

Pre-Permitting Environmental/ Socio-Economic Data Report Series

Report Series A-Meteorology

Report A-2 2007 Annual Data Report - Pebble 4 Station

Submitted to the Alaska Department of Environmental Conservation April 2008

Preliminary data. Do not cite or quote.

The Pebble Partnership is providing environmental and socio-economic baseline data collected to inform the development of the Pebble Project to state and federal agencies, project stakeholders and the general public prior to project permitting as part of its commitment to full and open disclosure.

A comprehensive Environmental Baseline Document (EBD) will subsequently be prepared and appended to future project permit applications. The EBD will also be made publicly available when complete.

Executive Summary

On behalf of The Pebble Limited Partnership, care of Pebble Mines Corp., its general partner, HCG, Inc., dba. Hoefer Consulting Group is collecting meteorological data to support baseline environmental studies, mine design objectives, and Prevention of Significant Deterioration (PSD) permitting needs for the Pebble Project.

PSD-quality meteorological monitoring for the Pebble Project began on August 1, 2005. This report provides details of the first year of meteorological measurements collected from January 1, 2007 through December 31, 2007 at the Pebble 4 station.

Table E-1 and E-2 provide monthly and annual valid data capture hours and the percent data capture, respectively, for the Pebble 4 meteorological monitoring station. The Pebble 4 meteorological monitoring station met all PSD requirements during the monitoring year with the exception of the vertical temperature difference parameter during Quarters C and D.

¹ CLM = Climatronics wind speed and wind direction sensor.

² RMY = R.M. Young wind speed and wind direction sensor.

³ Evaporation gauge decommissioned for winter. Gauge operated May 2 through October 5, 2007

⁴ The Climatronics wind speed sensor was affected by icing during Quarter D. The R.M. Young wind speed sensor will be used to achieve the required data capture requirement of 90 percent or greater per monitoring quarter.

1.0 Introduction

1.1 Project Summary

On behalf of the Pebble Limited Partnership, care of Pebble Mines Corp., its general partner, HCG, Inc., dba. Hoefer Consulting Group is collecting meteorological data to support baseline environmental studies, mine design objectives, and future Prevention of Significant Deterioration (PSD) permitting needs for the Pebble Project, an initiative to develop and operate an open-pit gold, copper, molybdenum, and silver mine in the Bristol Bay region of southwest Alaska. This project currently consists of three PSD-quality meteorological monitoring stations located at the proposed mill site (Pebble 1), the tailings storage facility (Pebble 4), and possible shipping site (Pebble Port). An additional, non-PSD meteorological monitoring station (Pebble 3) is being used for engineering and mine design purposes. This report focuses on the first year of measurements collected at the Pebble 4 station from January 1, 2007 through December 31, 2007. A separate annual data report has been prepared for each of the Pebble Port and Pebble 1 stations.

Figure 1-1 is a map of the Pebble Project meteorological monitoring sites located in southwest Alaska. Figures 1-2 and 1-3 provide a higher resolution map and a site photo, respectively, of the Pebble 4 station.

The Pebble 4 station collects data for the following parameters:

- Air temperature, two meters above ground (degrees Celsius [$^{\circ}\text{C}$])
- Air temperature, ten meters above ground (degrees Celsius [$^{\circ}\text{C}$])
- Vertical temperature difference (ΔT , “Delta T” (degrees Celsius [$^{\circ}\text{C}$]))
- Wind speed (meters per second [m/s])
- Wind direction (degrees [$^{\circ}$])
- Wind direction standard deviation (wind sigma [σ_0])
- Relative humidity (percent [%])
- Solar radiation (Watts per square meter [W/m^2])
- Barometric Pressure (millibar [mb]).
- Precipitation (millimeters [mm])
- Evaporation (millimeters [mm])

Measurements of these parameters will provide at least one year of representative surface observations for use in air dispersion modeling and PSD permitting needs.

1.2 Measurements Method Table

Table 1-1 lists each parameter measured at the Pebble 4 station and includes the sensor manufacturer and model number, measurement range, accuracy, sampling frequency, and sample averaging period. All instruments meet or exceed the U.S. Environmental Protection Agency (EPA) PSD requirements for range accuracies, thresholds, response times, resolutions, damping ratios, and other measures of instrument performance. For this project, wind speed and wind direction measurements are collected using two different types of PSD-quality sensors collocated at 10-meters above ground level. The Climatronics F460 (CLM) features a three-cup anemometer and separate wind vane, while the RM Young 05305-AQ (RMY) is a propeller-vane anemometer, which is a single unit consisting of a four-blade propeller fitted to the front end of a wind vane. Dual wind sensors are deployed at the Pebble 4 station to prevent the loss of valid data in the event that one of the sensors is damaged or subjected to inclement weather conditions. Because the manufacturers' stated wind speed accuracy, wind direction accuracy, and wind speed threshold values of the CLM sensor exceed those of the RMY sensor, the CLM sensor has been designated as the "primary" wind instrument at the Pebble 4 PSD station.

1.3 Variations from the Quality Assurance Project Plan

During the first monitoring year, there were no variations from the Pebble Project Meteorological Monitoring Quality Assurance Project Plan (QAPP).

Table 1-1. Meteorological Measurement Methods

Parameter	Sensor Manufacturer/ Model Number	Measurement Method	Range	Accuracy	Sampling Frequency	Averaging Period
Ambient Temperature	Met One, Inc. Model 062 MP	Solid state thermistor	+50°C to -50°C	± 0.05°C	1 second	1 hour
Wind Speed¹	Climatronics, Inc. F460 (P/N 100075)	Three-cup anemometer, LED photo chopper	0 to 65 m/s	± 0.15 m/s or 1%	1 second	1 hour
Wind Direction¹	Climatronics, Inc. F460 (P/N 100076)	Light-weight vane, Low torque potentiometer	0 to 360°	± 2°	1 second	1 hour
Wind Speed¹	RM Young Co. 05305-AQ	Propeller, magnetically induced AC sine wave	0 to 60 m/s	± 0.3 m/s or 1%	1 second	1 hour
Wind Direction¹	RM Young Co. 05305-AQ	Light-weight vane, Low torque potentiometer	0 to 360°	± 3°	1 second	1 hour
Relative Humidity	Vaisala, Inc. HMP 45C	Capacitive polymer chip	0.8 to 100%	± 2%	1 second	1 hour
Solar Radiation	LI-COR, Inc. LI200X	Silicon photovoltaic detector	0 to 3,000 W/m ² (400 to 1,100 nm)	± 5%	1 second	1 hour
Barometric Pressure	Vaisala, Inc. PTB 101B	Silicon capacitive sensor	600 to 1060 mb	± 0.5 mb	1 hour ²	N/A ²
Precipitation	Met One	Tipping bucket mechanism	0 to 76.2 mm/hr	± 1%	N/A ³	N/A ³
Evaporation	Nova Lynx 255-100	Change in pressure head determined by float mechanism	3 to 10 in	± 0.25% over 10 in range	1 second	1 minute

¹ Wind speed and wind direction measurements are collected using two different types of PSD-quality sensors.

² Instantaneous barometric pressure measurements are collected for 1 second during every hour.

³ Instantaneous precipitation measurements are collected by the datalogger and subsequently summed on an hourly basis.

Figure 1-1. Map of the Pebble Project Area

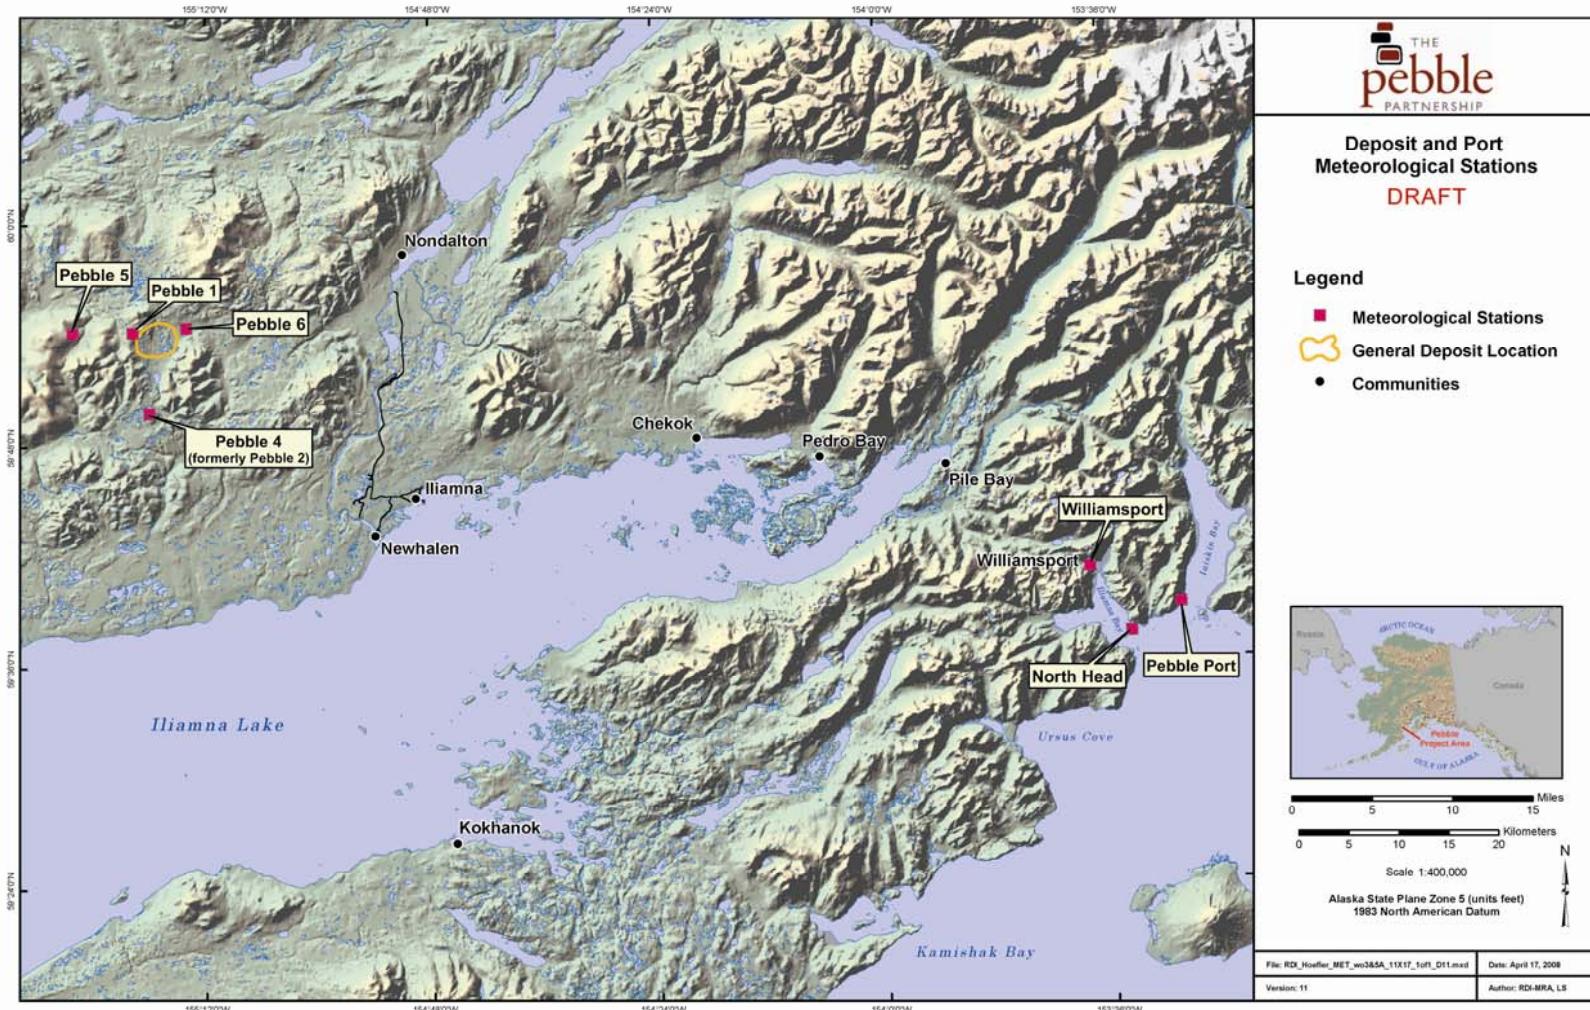

Figure 1-2. Map of the Pebble 4 Station

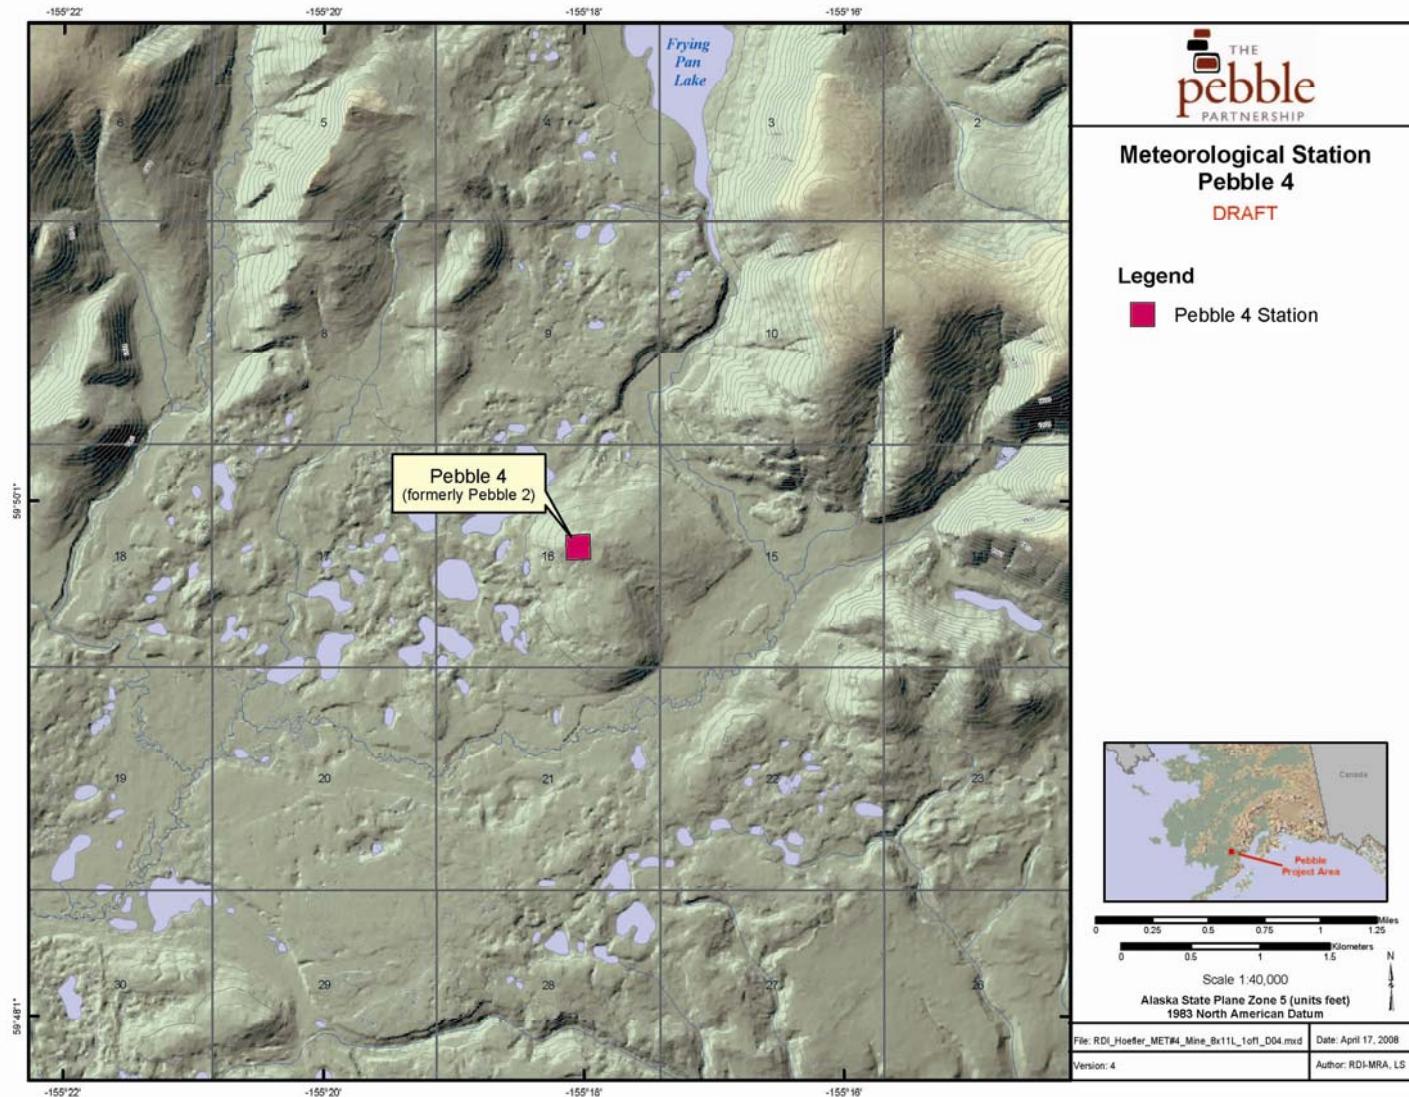

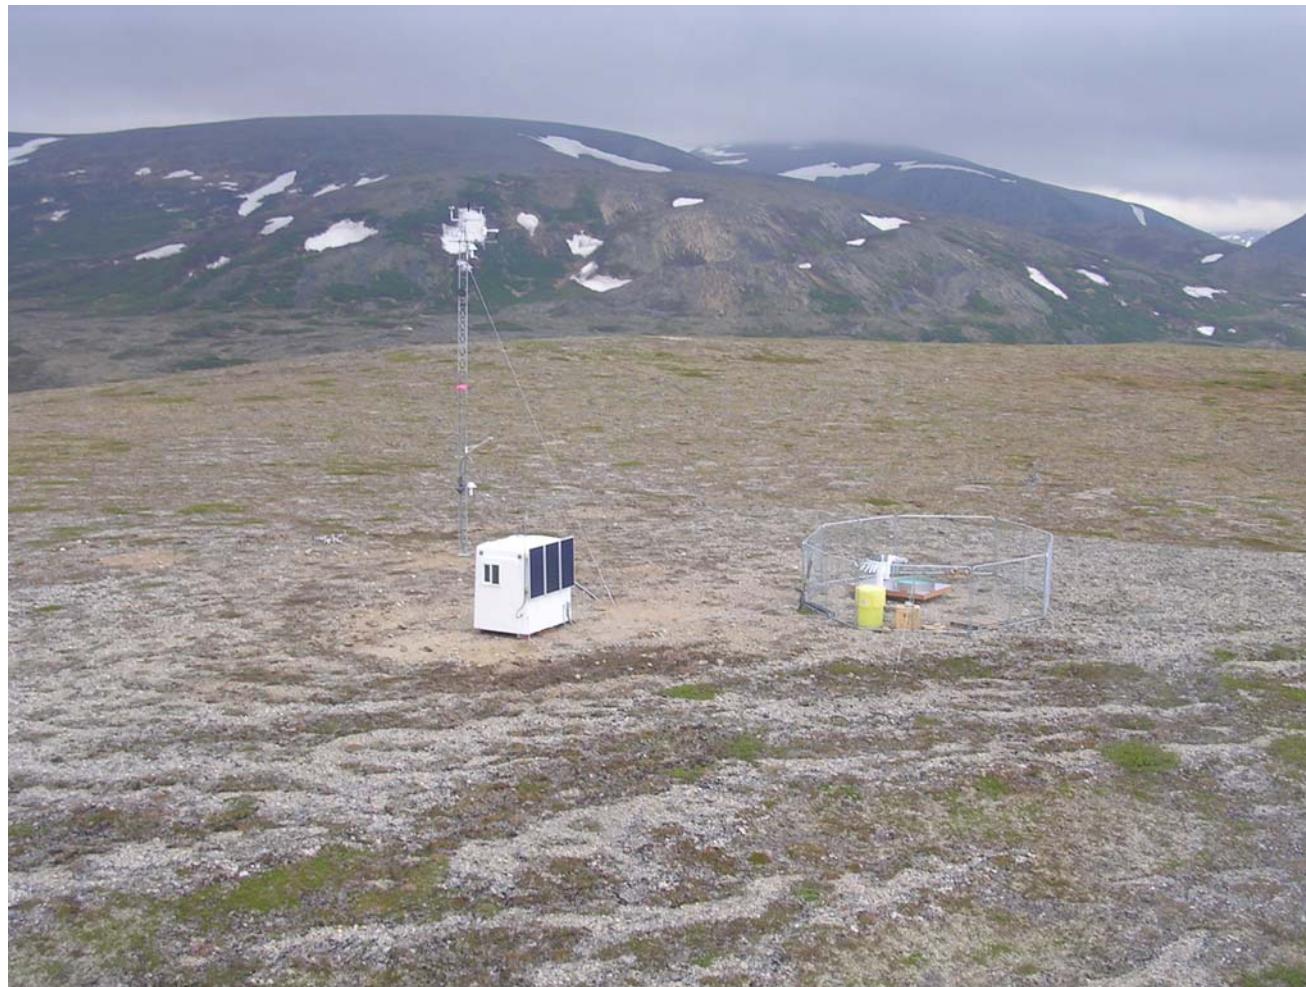

Figure 1-3. Pebble 4 Meteorological Monitoring Station

2.0 Station Performance Summary

2.1 Significant Project Events

Table 2-1 summarizes the significant events that occurred at the Pebble 4 station relevant to the 2007 meteorological monitoring year.

Table 2-1. Chronology of Significant Events

Date	Event
January 1, 2007	Beginning of 2007 monitoring year.
January 18, 2007	Full audit performed (all sensors passed), refreshed Metone precipitation gauge snowfall adapter.
March 22, 2007	Replaced aspirator control relay, uploaded new datalogger program, temporary repair of fence.
May 2, 2007	Calibrated and refreshed precipitation gauge, calibrated and started evaporation gauge, repaired evaporation fence, cleaned station and tightened guy wires.
Sept. 5-7, 2007	Station audit performed. Upgraded DAS to CR1000. Climatronics and RM Young wind instruments replaced.
October 18, 2007	Evaporation gauge decommissioned for winter. Valid evaporation data ends October 5, 2007.
November 7, 2007	Started Thermo-Electric Generator.
November 23-24, 2007	Climatronics wind speed sensor frozen. 20 Hours of wind speed data invalidated.
December 6-8, 2007	Climatronics wind speed sensor frozen. 39 Hours of wind speed data invalidated.
December 31, 2007	End of 2007 monitoring year.
February 12-13, 2008	Annual Performance audit conducted. Vertical temperature difference parameter failed audit. Data invalidated to date of last audit. Both 2-meter and 10-meter thermistors replaced and an as-left audit conducted.

2.2 Missing, Invalid, and Adjusted Data

The data for the Pebble 4 station were carefully reviewed during the quality assurance process. Some data were removed as a result of planned site activities, including data collected during station system and performance audits and calibrations.

All data were validated only after being screened by the criteria listed in Table 8-4 of *Meteorological Monitoring Guidance for Regulatory Modeling Applications* (EPA-454/R-99-005). Table 2-2 lists the quantities of data that were flagged according to EPA criteria, yet not removed from the refined final data set. All flagged data were carefully examined, but generally remained in the reduced data unless dictated by certain circumstances, including values outside the normal range of variation, consecutive repetitive values recorded for an unidentified reason, maintenance activity at the site, and impairing damage to sensors.

2.3 Network Data Completeness

Data completeness is a measure of the amount of data actually collected compared to the amount of data that could have been collected. Data completeness was calculated by dividing the number of valid hours of data by the total number of hours during the monitoring period. The data quality objective (DQO) for data completeness for the Pebble Project Meteorological Monitoring Program is 90 percent data capture per quarter for each parameter listed in Section 1.1. Table 2-3 provides a summary of data completeness, in terms of a percentage, for the 2007 monitoring year at the Pebble 4 station.

Table 2-2. Percentage of Final Data Set Flagged

Parameter	Flagging Criteria ¹	Percent Flagged
Wind Speed (Climatronics)	Value is < 0 m/s	0.0%
	Value is > 25 m/s	1.3%
	< 0.1 m/s variation for 3 consecutive hours	0.7%
	<0.5 m/s variation for 12 consecutive hours	0.0%
Wind Direction (Climatronics)	Value is < 0°, > 360°	0.0%
	<1° variation over 3 consecutive hours	1.8%
	< 10° variation over 18 consecutive hours	0.7%
Wind Speed (RM Young)	Value is < 0 m/s	0.0%
	Value is > 25 m/s	0.5%
	< 0.1 m/s variation for 3 consecutive hours	0.6%
	<0.5 m/s variation for 12 consecutive hours	0.0%
Wind Direction (RM Young)	Value is < 0°, > 360°	0.0%
	<1° variation over 3 consecutive hours	1.8%
	< 10° variation over 18 consecutive hours	0.7%
Temperature (2 meters)	> 5°C variation from previous hour	0.0%
	< 0.5°C variation for 12 consecutive hours	1.3%
	Value is > record high, < record low	0.0%
Temperature (10 meters)	> 5°C variation from previous hour	0.0%
	< 0.5°C variation for 12 consecutive hours	1.3%
	Value is > record high, < record low	0.0%
Temperature Difference, ΔT	Value is > 0.8°C during the daytime	0.3%
	Value is < -0.8°C during the night	0.0%
	Value is > 5°C, < -3°C	0.0%
Relative Humidity (Dew Point Temperature)²	Value is > ambient temperature	0.0%
	> 5°C variation from previous hour	0.0%
	< 0.5°C variation for 12 consecutive hours	1.3%
	Equals ambient temperature for 12 consecutive hours	1.9%
Solar Radiation	> 0 W/m ² at night	0.0%
	Greater than the maximum possible value for date	0.0%
Barometric Pressure	> 1060 mb (sea level)	0.0%
	< 940 mb (sea level)	3.7%
	> 6 mb variation for 3 consecutive hours	0.1%
Precipitation	> 25 mm in one hour	0.0%
	> 100 mm in 24 hours	0.0%
	< 50 mm in one month	49.4%

¹ Based upon Table 8-4: Suggested Data Screening Criteria in *Meteorological Monitoring Guidance for Regulatory Modeling Applications* (EPA-454/R-99-005).

² Guidance document provides criteria relative to dew point temperature.

¹ CLM = Climatronics wind speed and wind direction sensor.

² RMY = R.M. Young wind speed and wind direction sensor.

³ Evaporation gauge decommissioned for winter. Gauge operational from May 2 through October 5, 2007.

⁴ The Climatronics wind speed sensor was affected by icing during Quarter D. The R.M. Young wind speed sensor will be used to achieve the required data capture requirement of 90 percent or greater per monitoring quarter.

2.4 Precision Statistics

2.4.1 Monitoring Network Precision Statistics

Not applicable.

2.4.2 Analytical Laboratory Precision Statistics

Not applicable.

2.4.3 Analytical Laboratory Precision Statistics for Lead Analysis of Particulate Samples

Not applicable.

2.5 Accuracy Statistics

2.5.1 Instrument Calibration Statistics

Not applicable.

2.5.2 Independent Quality Assurance Audits

A preliminary systems and performance audit was conducted at the Pebble 4 station on July 12, 2006, all sensors passed. The results of the initial systems and performance audit are presented in Table 2-4.

A semiannual performance audit was conducted at the Pebble 4 station primarily on January 18, 2007. The evaporation pan and tipping bucket precipitation gauge were audited prior to winterization on October 11, 2006. The results of these performance audits are presented in Table 2-5 and Table 2-6.

An annual performance audit was conducted at the Pebble 4 station September 5 through September 6, 2007, all sensors passed. A second audit was performed on all station sensors from September 6 through September 7, 2007 to check sensor operation after replacing the CR10X data logger with a CR1000 data logger, all sensors passed. The results of these performance audits are presented in Table 2-7 and Table 2.8.

On February 12 through 13, 2008 an annual performance audit was conducted at Pebble 4. All sensors passed with the exception of the vertical temperature difference parameter. Both the 2-meter and 10-meter temperature thermistors were replaced and an as-left audit was conducted. Vertical temperature difference data was invalidated

from the date of the last audit on September 7, 2007. The results of this performance audit are presented in Table 2-9.

The performance audit involves reading the data acquisition system (DAS) output for each meteorological sensor and comparing the value with the input from appropriate audit equipment or from calibrated instruments collocated with the sensor. For each reading, the difference between the station value and the predicted value is compared with established PSD limits to assess the accuracy of the sensor.

During each of these audits, the power supply, DAS, communications system, and audited sensors all worked properly. A technical systems audit was performed during the September 5 and 6, 2007, audit and found that the station is well-planned, equipped with PSD quality equipment, and properly sited according to criteria recommended by EPA. The operator provided adequate manuals for system maintenance and proper documentation to report operation and quality control activities. The operator was knowledgeable and competent with all meteorological equipment, communications equipment, and the power supply system.

Appendix C contains all of the complete technical systems and performance audit reports.

3.0 Monitoring Data Network Summary

3.1 Air Quality Data Summary

Not applicable.

3.2 Meteorological Data Summary

3.2.1 Wind Speed (WS) and Wind Direction (WD) Climatology

Table 3-1 provides a statistical summary of Climatronics (CLM) and RM Young (RMY) wind speed measurements during the 2007 year of meteorological monitoring at the Pebble 4 station. The mean hourly average wind speed during the monitoring year was 8.29 m/s and 7.99 m/s for the CLM and RMY sensors, respectively. Maximum hourly average wind speeds of 37.57 m/s and 32.14 m/s were measured by the CLM and RMY sensors, respectively, on March 6, 2007. Table 3-2 provides the mean and maximum daily wind speeds at the Iliamna Airport, located approximately 20 km from the Pebble 4 station. During the monitoring year the mean daily average wind speed at the Iliamna airport was 3.95 m/s, while the maximum daily average wind speed was 17.88 m/s, recorded on December 9, 2007.

Table 3-1. Average and Maximum Wind Speeds at Pebble 4 Station

Monitoring Period	Mean Hourly Average Wind Speed (m/s) (CLM)	Mean Hourly Average Wind Speed (m/s) (RMY)	Maximum Hourly Average Wind Speed (m/s) (CLM)	Maximum Hourly Average Wind Speeds (m/s) (RMY)
Quarter A	10.29	9.55	37.57	32.14
Quarter B	6.74	6.64	29.98	27.20
Quarter C	6.32	6.20	25.26	23.87
Quarter D	9.90	9.58	33.32	31.82
Monitoring Year	8.29	7.99	37.57	32.14

Table 3-2. Average and Maximum Wind Speeds at Iliamna

Monitoring Period	Mean Hourly Average Wind Speed (m/s)	Maximum Hourly Average Wind Speed (m/s)
Quarter A	4.15	17.43
Quarter B	2.98	16.99
Quarter C	3.20	15.20
Quarter D	5.49	17.88
Monitoring Year	3.95	17.88

Figure 3-1 provides wind roses for the CLM and RMY wind instruments during the 2007 monitoring year. Winds were predominantly from the north, east, and southeast, with other minor wind components. Figures 3-2 and 3-3 present the quarterly wind roses for the CLM and RMY sensors, respectively. Quarters A and D are characterized by a major wind component from the north, with Quarter D also exhibiting a component from the east. Quarters B and C are characterized with a major component from the southeast and minor wind components the east and other directions. The Quarter A and Quarter D wind roses indicate a lack of southwesterly winds during this period. Tables 3-3 through 3-7 are the annual and quarterly wind analysis tables for the Climatronics wind measurements. Tables 3-8 through 3-12 are the annual and quarterly wind analysis tables for the RM Young wind measurements.

Figure 3-4 shows the 2007 monitoring year wind rose (derived from the Climatronics wind sensor measurements) superimposed over a map of the meteorological station and vicinity. The wind rose in Figure 3-4 is centered over the location of the Pebble 4 station.

Figure 3-4. 2007 Wind Rose Superimposed on Site Map

3.2.2 Temperature Climatology

Tables 3-13 and 3-14 provides maximum and minimum daily mean temperatures, monthly mean temperatures, and maximum and minimum hourly average temperatures for the 2-meter and 10-meter temperature measurements, respectively. Hourly average temperatures at the Pebble 4 station ranged from 23.0°C on August 12, 2007 to -31.1°C on January 7, 2007. January 7, 2007 was also the coldest day at the Pebble 1 meteorological station. The average 2-meter temperature during the monitoring year was 0.0°C, which is slightly less than the mean temperature of 1.78°C observed at the Iliamna airport during the same time span.

Figure 3-5 provides a graph of the 2-meter and 10-meter hourly average temperatures. There was considerable monthly temperature variation throughout the late-autumn and winter months. The coldest temperatures were observed during January 2007. Figure 3-5 also includes a plot of average daily temperatures recorded at the Iliamna Airport meteorological monitoring station.

Figure 3-6 is a plot of the vertical temperature difference (the difference between 10-m and 2-m temperature values) during the monitoring year. The greatest positive vertical temperature difference was 2.8°C measured on January 4, 2007. The greatest negative vertical temperature difference was -1.7°C measured on July 28, 2007.

Table 3-13. 2-Meter Temperature Summary

Period	Maximum Daily Mean Temperature (°C)	Minimum Daily Mean Temperature (°C)	Monthly Mean Temperature (°C)	Maximum Temperature (°C)	Minimum Temperature (°C)

3.3.3 Other Meteorological Parameters

Other measured meteorological parameters include relative humidity, barometric pressure, solar radiation, precipitation, and evaporation.

Table 3-15 provides a summary of the relative humidity, barometric pressure, and solar radiation at the Pebble 4 station during the 2007 monitoring year.

Figure 3-7 is a plot of the annual hourly average relative humidity. The mean relative humidity at the Pebble 4 station was 82.8 percent. The minimum relative humidity was 27.1 percent, measured on March 31, 2007. The mean relative humidity at the Iliamna Airport meteorological station for the monitoring period was 75.5 percent.

Figure 3-8 is a plot of the annual hourly instantaneous barometric pressure. Barometric pressure varied from a minimum of 923 mb on October 30, 2007 to a maximum of 987 mb observed on March 31, 2007. The mean barometric pressure during the monitoring year was 961 mb. The mean barometric pressure at the Iliamna Airport meteorological station for the monitoring period was 1,007 mb.

Figure 3-9 is a plot of the annual hourly average solar radiation. The maximum hourly average solar radiation was 910 W/m² recorded on June 18, 2007. The mean hourly average solar radiation for the monitoring year was 98 W/m².

Figure 3-10 is a graph of total daily precipitation and the cumulative precipitation during the 2007 monitoring year. The highest total daily precipitation was 42.8 mm measured on September 18, 2007. The maximum monthly precipitation was 310.2 mm during September 2007. The cumulative precipitation during the monitoring year was 877.2 mm. Daily winter precipitation data (October through April) should be closely examined before use because snowfall adaptors may influence daily totals.

A table of total daily evaporation is provided in Appendix D. The maximum total monthly evaporation at the Pebble 4 station was 89.8 mm during June 2007.

Comprehensive hourly data tables of temperature, vertical temperature difference, wind speed, wind direction, wind sigma, relative humidity, barometric pressure, and solar radiation are also provided in Appendix D.

Table 3-15. Relative Humidity, Barometric Pressure, and Solar Radiation Summary

Period	Mean Relative Humidity (%)	Minimum Relative Humidity (%)	Mean Barometric Pressure (mb)	Minimum Barometric Pressure (mb)	Maximum Barometric Pressure (mb)	Mean Solar Radiation (W/m^2)	Maximum Solar Radiation (W/m^2)
January 2007	86.2	45.9	957	929	985	17.1	188.0

Appendix A

Data Processing Specifications and Statistical Formulae

A.1 Data Recovery Percentage

Data completeness for meteorological monitoring methods was calculated assuming a minimum of 90 percent valid hourly average data to calculate quarterly average data completeness and a minimum of 90 percent quarterly data completeness for four consecutive quarters.

Quarterly data completeness (DC_i) was determined using the following equation:

$$DC_i = h_v/h_i \times 100$$

Where: h_v = number of hours of valid data actually collected
 h_i = number of possible valid hours of data collection during the monitoring period

Table A-1. Station Performance Summary – Data Recovery 2007

1.0 INTRODUCTION

Hoefer Consulting Group, Inc. (HCG) operates meteorological monitoring stations for Northern Dynasty Mines, Inc. (NDM) in support of the Pebble Mine Project near Iliamna, Alaska. The air monitoring program is one component of ongoing baseline environmental studies being conducted to support mine permitting, mine design and mine transportation infrastructure development. The stations meet Prevention of Significant Deterioration (PSD) guidelines, although PSD permits may not be required. This report covers the Pebble 4 Station (Pebble 4) located near the proposed mine site.

Pebble 4 is located approximately five miles south of the mine ore body on top of a windswept knoll at about 1,200 foot elevation. The station consists of an instrumented 11-meter sectional tower secured with three guy wires. Approximately 50 foot south of the tower is an evaporation pan and a tipping precipitation gauge mounted on a 6' by 8' deck. Between the tower and the gauges is a 5' by 7' insulated building which houses the datalogger and power supply system. Pebble 4 is instrumented with PSD quality sensors monitoring the following parameters:

- Ambient Temperature (°C): Met One 062MP Thermistor Probe at 2-m
- Temperature Difference (°C): Met One 062MP Thermistors at 2-m and 10-m
- Relative Humidity (%RH): Vaisala HMP45AC Relative Humidity Sensor
- Wind Speed 1 (m/s): Climatronics F460 P/N 100075 Wind Speed Sensor
- Wind Direction 1 (°): Climatronics F460 P/N 100076 Wind Direction Sensor
- Wind Speed 2 (m/s): RM Young 05305 Wind Monitor-AQ
- Wind Direction 2 (°): RM Young 05305 Wind Monitor-AQ
- Sigma Theta (°): Campbell Scientific CR10X DAS calculated (Yamartino)
- Barometric Pressure (mbar): Vaisala PT101B Barometric Pressure Sensor
- Solar Radiation (W/m²): LI-COR Li-200SX Solar Radiation Pyranometer
- Precipitation (mm H₂O): Met-One Model 370 Tipping Precipitation Gauge
- Evaporation (mm H₂O): Nova-Lynx Model 255-100/200 Pan and Gauge.

This report has been prepared for NDM to serve as an official review of the Pebble 4 station and a review of the overall Pebble Project Meteorological Monitoring Program. To that end, Systems and Performance Audits were undertaken in order to help demonstrate that the equipment and procedures used for collecting meteorological data by HCG meet the requirements set forth by the U.S. Environmental Protection Agency (EPA) and the Alaska Department of Environmental Conservation (ADEC).

2.0 SYSTEMS AUDIT

2.1 Systems Audit Methodology

In the *Quality Assurance Handbook for Air Pollution Measurement Systems* and the *Meteorological Monitoring Guidance for Regulatory Modeling Applications*, EPA provides guidance for conducting systems audits. EPA recommends that a systems audit be conducted to serve as a qualitative review of all aspects of a meteorological monitoring program. The systems audit includes a review of the program plan, station site, facilities, equipment, personnel, procedures, record keeping, data validation and data reporting. The systems audit should be completed within the first 30 days of operation and every year thereafter.

The *Quality Assurance Project Plan for the Pebble Project Meteorological Monitoring Program* was completed by HCG in August 2006. This systems audit consisted of a review of the plan, site visits and personnel interviews. Personnel were also observed during station maintenance and calibration operations. All aspects of the program not specifically mentioned in the Plan were reviewed to determine consistency with EPA and ADEC guidelines. The complete systems audit report contained in Appendix A is organized into six major sections; 1) General Program Information, 2) Monitoring Program Staff Organization, 3) Meteorological Monitoring Station Equipment, 4) Standard Operating Procedures, 5) Documentation, 6) Data Processing and Validation, 7) Quality Assurance and Quality Control (QA/QC), and 8) Comments and Suggestions. Each section consists of a question and answer format with additional comments to provide clarity. Flow charts are also used to accurately document program staff organization and the data handling process. A complete list of the references used for the systems audit is contained in Section 4.

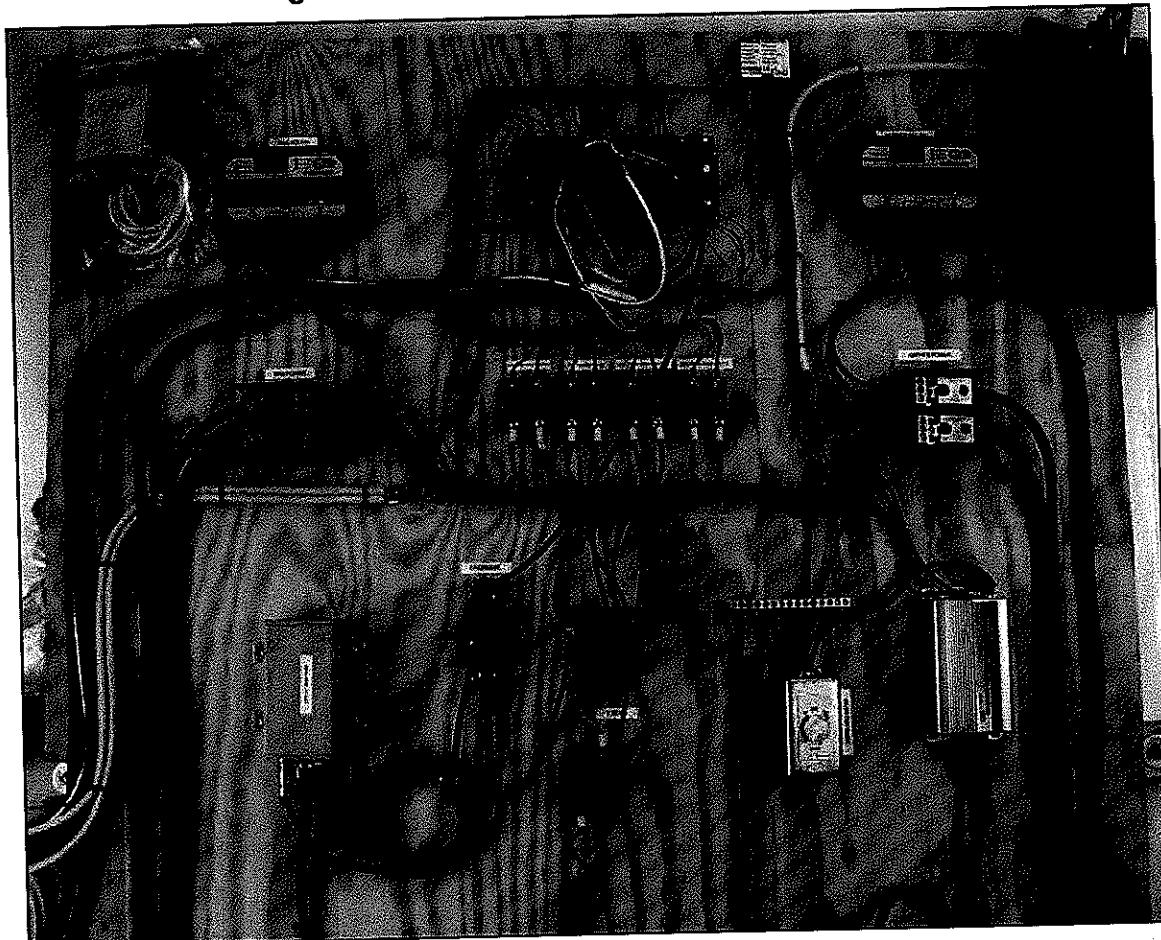

2.2 Meteorological Station Onsite Systems Audit

The on-site systems audit of the Pebble 4 station was conducted in mid July 2006. Eric Brudie of HCG completed the systems audit with Dominic Shallies of HCG assisting and witnessing. Mr. Brudie serves as an independent auditor on this project and is not involved with day to day operations of the station.

The Pebble 4 meteorological monitoring station is founded on a stable, well anchored tower with PSD quality sensors securely affixed. The evaporation pan, evaporation gauge and a tipping precipitation gauge are mounted on a 6' by 8' deck supported on four adjustable pier blocks, which allow leveling. The evaporation deck is surrounded by a 6' high fence and all instrumentation wires from the tower, precipitation gauge and evaporation gauge are protected in conduit. These conduits all converge at a 5' by 7'

insulated prefab building. The data acquisition system (DAS), communications system, solar controllers and power distribution system are mounted on a 4' by 4' plywood wiring panel mounted in the building, see photo.

Figure 2-1 Pebble 4 Station DAS Wiring Panel

The Campbell Scientific CR10X DAS wiring is well organized and needs no further discussion. Constant communication between the DAS and a dedicated polling computer in the HCG office is integral to this installation. FreeWave spread spectrum radio modems transmit the signal to a SixNet industrial phone modem which is linked to the grid in Iliamna. The met station radio and base radio rely on directional Yagi antennas focused on an omni-directional antenna at the repeater radio. The repeater radio is powered by one 70-Watt solar panel buffered through a solar controller and five 100 Amp-Hr deep cycle gel cell batteries.

Power generation at the meteorological monitoring station consists of three 70-Watt solar panels and a Global Thermoelectric Generator (TEG). One solar panel is

dedicated to the DAS and meteorological instrumentation; wired through a solar controller and buffered through two 200 Amp-Hr deep cycle gel cell batteries. Two solar panels are dedicated to the aspirator fans, Climatronics bearing heaters, shelter lighting and 120VAC power; also wired through a solar controller and buffered through two 200 Amp-Hr deep cycle gel cell batteries. The shelter lights and 120VAC inverter for laptop use are routed through manual timers to ensure use only when operators are on site. During the winter months, November through April, the TEG is turned on to supplement the power system. The TEG power is routed through relays wired to the DAS control ports which isolate the critical DAS/sensor system during upset conditions. Climatronics heaters are also controlled through relays programmed to limit heater use to weather conditions conducive to icing. All system battery voltages are constantly monitored by the DAS.

2.3 Operations, Data Management and Documentation Systems Audit

This phase of the systems audit consists of a review of the *HCG Quality Assurance Project Plan for the Pebble Project Meteorological Monitoring Program* (Plan), and other system documentation, and a review of system operations. System operations include physically running the station and subsequent data management.

The Plan is a comprehensive document which adequately details the Pebble meteorological monitoring program. Program objectives, installations, operations, data management and quality assurance are all clearly outlined. Equally, the Pebble 4 station is representative of the Plan design. The Plan provides standard operating procedures and standard forms for all equipment field calibrations and audits. Station operators also had complete DAS and meteorological sensor manuals on hand at the station. Plan and documentation review are covered further in Appendix A.

Station operators were observed during calibration and maintenance procedures and appeared knowledgeable about all facets of operating the monitoring station. Data are downloaded daily using an automated script on a dedicated polling computer located at the HCG office. The raw data are appended to a station file located on the HCG server, which is backed up daily. The data manager copies the raw data to a custom Access/Excel database, leaving the raw data unaltered. The custom database creates a series of graphs of all meteorological data as well as some station operational parameters. These plots are reviewed 5-6 days per week in order to immediately identify station upsets. An example is a graph of solar radiation and battery voltage; which reveals potential problems with daily charge cycles. Both the Climatronics and RM Young Wind sensor data are plotted together to indicate problems with one of the sensors. All station parameters are plotted with ranges and pairings intended to best

Hoefer Consulting Group

reveal upset conditions. Problems are immediately identified and corrective action planned and executed. Steps are taken to flag data which may have been identified as suspect during this graphical data review. Data generated during station maintenance, audits and calibrations are also flagged as invalid.

Prior to compilation of data summary reports, data are screened using EPA recommended screening criteria. Data flagged as outliers by the screening program are further reviewed for consistency with prevailing conditions and then permanently invalidated or validated. Data ultimately invalidated are permanently removed from the database and the reasoning is codified in a special column in the database. This cleaned dataset is used for all subsequent data summaries, wind roses, data reports and capture rate calculations. More detailed discussion of the operations and data management are contained in the Systems Audit Appendix A.

2.4 Comments and Suggestions

The Pebble 4 station is a well designed and operated meteorological monitoring station. The remote station is equipped with a robust and sophisticated power supply which is constantly monitored. The systems audit revealed that HCG possesses the necessary organization, personnel, training, equipment, quality assurance, and quality control procedures to accurately collect and report PSD quality data. HCG adequately maintains the Pebble 4 station and practices sufficient data review and preventive maintenance to avoid unnecessary data loss.

The following recommendations are made to the program in order to improve the operation of the stations and ensure their operation is in accordance with standards:

- Create custom site visit procedural and inventory checklists
- Keep files on site containing copies of previous visit checklists
- Always use paper calibration forms as well as computer entered forms.

3.0 PERFORMANCE AUDIT

3.1 Performance Audit Methodology

During the performance audit, the station datalogger is interfaced with a portable laptop computer to display the outputs for the meteorological sensors. The value of each meteorological sensor is compared to the output value from the appropriate piece of audit equipment or from calibrated instruments collocated with the sensor. The difference between the station's datalogger reading and the output from each audit instrument is compared with established PSD limits to determine the accuracy of each sensor. Additionally, threshold torques for wind speed and wind direction are measured with audit equipment and compared with manufacturer torques corresponding to the PSD threshold speed of 0.5 m/s. Table 3-1 provides a summary of the performance audit methods and limits used to audit each parameter at the stations.

Table 3-1 Performance Audit Methods and Acceptable Limits

Parameter	Audit Method	EPA/Manufacturer Limit
Datalogger Time	NOAA Clock	$\leq \pm 5:00$ minutes from AST
Temperature Accuracy	Collocated NIST thermistor	$\leq \pm 0.5$ °C
Temperature Difference	Collocated NIST thermistor	$\leq \pm 0.1$ °C
Relative Humidity	Collocated NIST RH sensor	$\leq \pm 1.5$ °C of dew point
Wind Speed Accuracy	Synchronous rpm motor	$\leq \pm 0.2$ m/s + 5 % observed
Wind Spd Torque (Clim)	Torque watch	≤ 0.35 g-cm (0.0049 oz-in)
Wind Spd Torque (RMY)	Torque watch	≤ 1.0 g-cm (0.014 oz-in)
Wind Direction Alignment	GPS, compass or landmark	$\leq \pm 5$ ° from true azimuth
Wind Direction Accuracy	Linearity tester	$\leq \pm 5$ ° per audit point
Wind Direction Linearity	Linearity tester	≤ 3 ° mean absolute average
Wind Dir Torque (Clim)	Torque watch	≤ 7.5 g-cm (0.104 oz-in)
Wind Dir Torque (RMY)	Vane torque gauge	≤ 11 g-cm (0.153 oz-in)
Barometric Pressure	Collocated NIST BP sensor	$\leq \pm 3$ mbar
Solar Radiation	Collocated NIST sensor	$\leq \pm 5\%$ of input+resolution ¹
Precipitation	Calibrated water volume	$\leq \pm 10\%$ of input
Evaporation	Measured water level	$\leq \pm 10\%$ of input

1. This audit limit is modified from PSD standard, as discussed below.

3.1.1 Data Acquisition System

An audit of the datalogger is conducted by comparing all datalogger outputs to the audit standards, as described below. The datalogger time is checked against an instantaneous time reading from the National Oceanic and Atmospheric Administration (NOAA) clock in Boulder, Colorado, via a global positioning system (GPS) handheld unit or telephone contact with the NOAA clock.

3.1.2 Air Temperature and Air Temperature Difference

The 2-meter and 10-meter thermistors are removed from their aspirator shields and collocated with a National Institute of Standards and Technology (NIST) traceable digital thermometer. The station thermistors and the transfer standard NIST thermometer are taped together and immersed in insulated thermoses containing a series of fluid baths; hot water (35°C to 45°C), warm water (15°C to 25°C), water/ice bath (0°C), cold glycol (-15°C to -25°C) and very cold glycol (-35°C to -45°C). Dry ice is used to cool the glycol baths. Each liquid bath is agitated and allowed to equilibrate before simultaneous readings are taken from the three instruments.

An alternate method can also be used for the low temperature audits, employing a Thermal Mass Device (TMD). The TMD consists of a 6" diameter by 9" high solid aluminum block milled to fit snuggly inside of an insulated Dewar flask. On the top of the TMD, and in corresponding locations on the flask lid, are holes sized to accommodate a variety of Campbell, Climatronics, Met-One and VWR thermistors. The TMD is cooled to the target temperatures by contact with dry ice and then placed in the insulated flask. The audit and station thermistors are inserted through the flask lid and into the appropriate holes in the TMD. After the TMD and the thermistors are allowed to equilibrate, readings for all thermistors are simultaneously taken. The aluminum TMD has a very high thermal conductivity and when allowed to equilibrate inside of the insulated flask, thermal gradients across the TMD are very small.

In all cases, the difference between the individual station thermistors and the NIST standard are compared to the PSD temperature accuracy limit of $\pm 0.5^{\circ}\text{C}$. The difference between the two station thermistors (10-m°C minus 2-m°C) is compared to the PSD temperature difference limit of $\pm 0.1^{\circ}\text{C}$.

3.1.3 Relative Humidity

Relative humidity (RH) is audited using a collocated NIST traceable RH sensor. The NIST sensor and the field sensor are collocated out of direct sunlight to eliminate solar radiation effects, preferably inside of the motor aspirated shield. If the NIST standard reads directly in dew point °C, those readings are used; if not, relative humidity and

temperature readings are used. For the audit, instantaneous readings of dew point, relative humidity and ambient temperature are recorded from the transfer standard and the DAS. All relative humidity and temperature readings are converted to dew point in order to assess the PSD error limit of $\pm 1.5^{\circ}\text{C}$ dew point.

3.1.4 Wind Speed

Anemometers are audited to determine their accuracies in reading known wind speeds and to ascertain the sensor's threshold torque. The Climatronics and RM Young sensors are audited in very similar manners and are discussed together. The instruments are tested after removal from the tower and after removal of the sensor's props or cups.

First, an RM Young synchronous motor is attached to the shaft of the anemometer by using brand specific coupling devices. The sensor shaft is rotated at several different known revolutions per minute (rpm). Each rotational speed in rpm is equated to a wind speed in meters per second (m/s) by using the anemometer manufacturer's linear calibration formula. The difference between the calculated input speed in m/s and the datalogger output is compared to established PSD limits for each input rpm.

Next, a high precision torque watch is attached to the shaft of the anemometer, once again using custom couplings. Torque readings are made in both directions in each quadrant along the axis of rotation of the shaft. The maximum reading is recorded for the torque required to turn the shaft of the anemometer. The torque value recorded during the audit is compared to manufacturer's torque corresponding to the minimum PSD threshold speed of 0.5m/s.

3.1.5 Wind Direction

The wind direction sensors are first audited as-found to determine the accuracy of their alignment with respect to true north (true azimuth alignment) using one of four methods. In one method, a handheld GPS unit is used to measure the position of the auditor with respect to a waypoint captured under the wind sensor's position on the tower. Using binoculars, the tail of the wind vane is aligned with the auditor's position at a distance of several hundred feet from the tower. The GPS bearing back to the tower waypoint is then compared to the DAS reading. The difference between the two should not exceed $\pm 5^{\circ}$ per audit point. This procedure is repeated at least 4 times, once per quadrant, generally near the cardinal directions. The second method uses a calibrated precision compass mounted on a gimbal and tripod. The compass declination is preset for the specific location and date using one of a variety of magnetic declination computer models. The sensor tail is aligned toward the auditor while auditor sights the

compass toward the sensor and readings are taken in a similar manner to the GPS method.

Another option is to align the tail of the sensor with a distant identifiable landmark of known bearing. The bearing to the landmark may be ascertained using a variety of methods. One method involves physically capturing a distant GPS waypoint, such as at a discernable structure or emissions stack. Bearings to inaccessible natural landmarks, usually distant mountain peaks, are acquired through the use of various computer mapping programs, such as Natural Geographic's TOPO program or USGS digital raster graphics (DRGs) loaded into AutoCAD. The bearing from the station location to the landmark is compared to the DAS reading. This method yields the most accurate audit value, but is limited by weather and availability of discernable landmarks. The final method is to align the vane with the tower guy wires or preset survey markers, whose bearing has been ascertained using precision survey equipment.

The wind direction accuracy and linearity are subsequently audited after the wind direction sensor is removed from the tower. The Climatronics sensor is mounted on a Climatronics Model 101984 linearity tester and the RM Young sensor is mounted on an RM Young Model 18112 Vane Angle Bench Stand. Both test fixtures are keyed to their respective sensor and graduated from 0° to 360°. A series of readings starting at 30° and then clockwise in 30° increments are taken. The RM Young is read from 30° to 360° and the Climatronics is read from 30° to 540°. The Climatronics sensor is tested 180° past 360° in order to test the second potentiometer used in some DAS programming. Although not required, the Climatronics sensor is also tested with the vane attached in order to ascertain sensor accuracy and linearity relative to the instrument crossarm. The vane is aligned along the axis of the crossarm to yield the 0°/360° and 180° values and against a square held to the crossarm for the 90° and 270° directions. Four readings are taken in a clockwise direction and four are taken counterclockwise to complete the test. For both the linearity test fixture and crossarm tests, individual error values are assessed for the PSD accuracy limit of ±5° per point and the mean absolute average error is assessed against the linearity limit of 3°.

Next, the RM Young wind direction threshold is tested by measuring wind vane torque using an RM Young Model 18331 Vane Torque Gauge. This device saddles the wind vane and a calibrated spring is pulled to determine maximum torque from readings taken in both directions in all four quadrants. The Climatronics wind direction starting torque is measured with the vane removed by using a precision torque watch in the same manner as the wind speed torque. The highest torque readings are compared to specific manufacturer limits for instrument starting torque.

Finally, the wind direction sensors are placed back on the tower and as-left audits of the azimuth alignments are conducted to ensure the instruments are properly reinstalled.

3.1.6 Barometric Pressure

Barometric pressure (BP) is audited using a collocated NIST traceable BP sensor. The difference between the NIST sensor and the station sensor are compared to the PSD limit of ± 3 mbar.

3.1.7 Solar Radiation

Outputs of the station sensor are compared to the output of a level collocated audit solar radiation sensor. The audit sensor is connected to an independent audit datalogger with the scan interval and clock synchronized with the station DAS. Hourly average solar radiation readings and instantaneous readings are recorded during the audit and then input into a custom spreadsheet to calculate a linear regression for the data. The PSD limit for solar radiation audits is $\pm 5\%$ of observed, but this standard is very difficult to obtain at the northern latitude of this installation. This EPA standard is currently undergoing review and is expected to change. A well excepted substitute is that individual DAS and audit data pairs are compared to a limit of $\pm 5\%$ of observed + **EPA minimum instrument resolution ($10W/m^2$)**. Individual data pairs are evaluated against this standard, but the overall set is restricted to a 5% error by limiting allowable linear slope to 1.0 ± 0.05 .

3.1.8 Precipitation

The Met-One tipping precipitation gauge is audited by slowly adding precisely measured volumes of water to the gauge using a dripping Nova Lynx Model 260-2595 Rain Gauge Calibrator. The predicted millimeters of precipitation corresponding to the measured volume added are calculated using the diameter of the gauge opening. The tare reading from the DAS is initially recorded and subsequent DAS readings are recorded after each test run. The percent difference between the predicted audit value and the DAS value is compared to the PSD limit of $\pm 10\%$.

3.1.9 Evaporation

The evaporation gauge is first checked to confirm that the pan and gauge are level. The accuracy is checked by first removing or adding enough water to bring the initial level to approximately 50 mm or 240 mm, the minimum and maximum for this gauge. An accurate millimeter scale is taped to the inside of the evaporation pan and the water level on the scale is compared to the DAS output. Water is added to or removed from the pan to change the level by 10-20mm and another set of readings are taken. This process is repeated until the level in the pan reaches the upper or lower limit of the

gauge. The resultant suite of DAS and scaled water level readings are then input into a custom spreadsheet which calculates a linear regression for the data. The evaporation gauge reads change in water level due to evaporation and rainfall, so the calculated intercept must be removed from measured water levels. The adjusted level is compared to the DAS output with a maximum allowable error of $\pm 10\%$ of input and the slope of resultant line has a limit of 1.0 ± 0.1 .

3.2 Performance Audit Results

The performance audit was conducted at the Pebble 4 station on July 12, 2006, with Dominic Shallies of HCG assisting. All sensors were challenged with certified audit equipment and yielded errors below the PSD limits. Summary audit results are contained in Table 3-2 and complete audit reports and audit equipment calibration certificates are contained in Appendix B and Appendix C respectively.

3.3 Performance Audit Recommendations

- None.

Table 3-2 Pebble 4 July 12, 2006 Performance Audit Summary

Parameter	Limit	Units	Max Err	Status
Datalogger Time	$\leq \pm 5:00$	Min:Sec	-0:02	Pass

Auditor: Eric Brudie

1.0 GENERAL PROGRAM INFORMATION

1.1 Site Description

The Pebble 4 station is located on the crest of a knoll approximately 5 miles south of the mine ore body. The site is windswept and treeless with very little organics and virtually no obstructions around the station.

1.2 Site Location

1.2.1 Coordinates

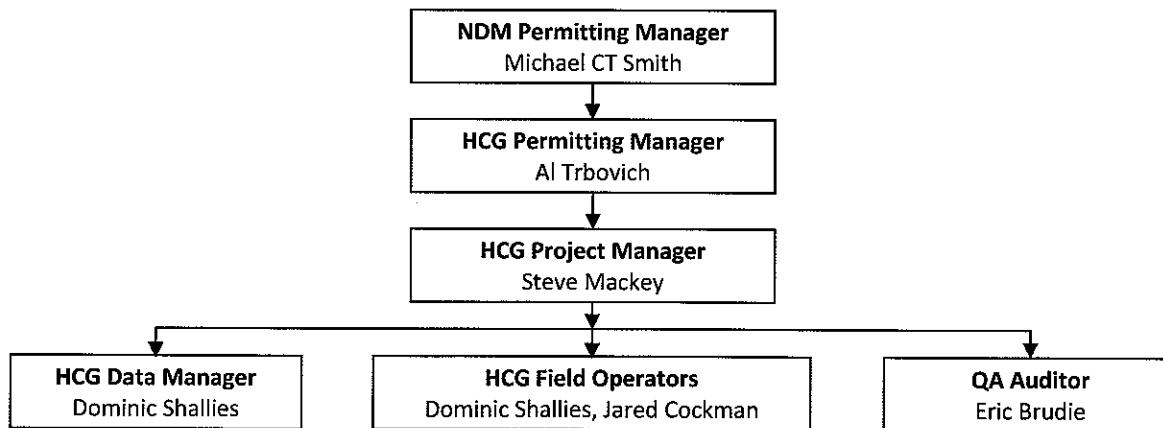

Indicated by Operator	Determined by Auditor
59° 50' N	59° 49.837 N
155° 18' W	155° 18.041'
Elevation: 1,200 feet	Elevation: 1,190 feet

1.2.2 Appearance and Safety

- Does the site appear clean, organized and well maintained? Yes Comments: None.
 No
- Does the site appear to be safe and reasonably hazard free? Yes Comments: None.
 No
- Does the site have a shelter for operators? Yes Comments: None.
 No
- Does the site have emergency equipment such as a first aid kit available? Yes Comments: None.
 No
- Does the site have adequate measures to prevent human tampering? Yes Comments: Remote site.
 No
- Does the site have adequate measures to prevent damage from animals? Yes Comments: Cables protected in liquid-tight conduit and electronics inside shelter.
 No

2.0 MONITORING PROGRAM STAFF ORGANIZATION

- Draw a diagram of the organizational structure of the monitoring program, including names and titles:

Evaporation Gauge	NovaLynx	255-100	687
Evaporation Pan	NovaLynx	255-200	None

3.2 Equipment Evaluation

3.2.1 Data Acquisition System (DAS) and Communications System

- | | | |
|--|--|--|
| Is the DAS well protected from the elements with adequate room for maintenance? | <input checked="" type="checkbox"/> Yes
<input type="checkbox"/> No | Comments: <u>DAS inside of a weatherproof building, mounted on a 4'x4' wiring panel.</u> |
| Is the DAS rated for operation in the expected local temperature range? | <input checked="" type="checkbox"/> Yes
<input type="checkbox"/> No | Comments: <u>-55°C to + 85°C.</u> |
| Are all sensor cables neatly and securely connected to the correct DAS channels? | <input checked="" type="checkbox"/> Yes
<input type="checkbox"/> No | Comments: <u>Well organized wiring panel.</u> |
| Is remote communication to the DAS system available to operators? | <input checked="" type="checkbox"/> Yes
<input type="checkbox"/> No | Comments: <u>DAS connected to FreeWave network linked to SixNet modem on telephone grid.</u> |
| Are all components of the DAS and communications system operational? | <input checked="" type="checkbox"/> Yes
<input type="checkbox"/> No | Comments: <u>None.</u> |
| Are the DAS and communication equipment properly grounded? | <input checked="" type="checkbox"/> Yes
<input type="checkbox"/> No | Comments: <u>8' ground rod wired to central ground buss.</u> |
| Are the DAS and communication equipment protected from lightning? | <input checked="" type="checkbox"/> Yes
<input type="checkbox"/> No | Comments: <u>There is no lighting protection, but area not prone to strikes.</u> |

Auditor: Eric Brudie

3.2.2 Power Supply System

Does the system have a stable power supply or line power? Yes Comments: Very robust alternative power supply described below.
 No

- Describe the meteorological monitoring station power supply system.

The DAS, communications equipment and meteorological sensors are powered by one 70-Watt solar panel, buffered through two 200 amp-hr deep cycle gel cell batteries. The aspirator fans and Climatronics wind sensor heaters are powered by two 70-Watt solar panels buffered through two 200 amp-hr deep cycle gel cell batteries. During the winter months (November through April), the aspirator/heater system is also powered by a propane Thermo-Electric Generator (TEG). The isolated DAS and Aspirator power systems can be interconnected during upset conditions through an array of relays managed through the DAS control ports. The DAS monitors battery levels and can connect the two power systems should one run low. The DAS also has algorithms programmed to assess weather conditions and limit heater use when not essential.

3.2.3 Meteorological Monitoring Sensors

Do all sensors appear to be clean, intact, in good condition and well maintained? Yes Comments: None.
 No

Are all sensors operational, online and reporting data? Yes Comments: None.
 No

Do all sensors meet EPA criteria for PSD quality sensors? Yes Comments: See table below.
 No

Are spare parts stocked for items which are frequently worn out or broken? Yes Comments: Spare props, cups and vanes onsite and spare bearings in field kit.
 No

3.2.4 EPA PSD Meteorological Instrument Standards

Parameter	Instrument Specifications	EPA Standard	Pass?
Air Temperature (2-M, 10-M & Delta-T) – Met One Mdl. 062MP			
Accuracy (2-m & 10-m):	±0.05 °C	±0.5 °C	Yes
Accuracy (Delta-T):	±0.02 °C	±0.1 °C	Yes
Range (Operating Temp):	-50°C to +50°C	-20°C to +30°C	Yes
*Resolution (2-m & 10-m):	0.01°C	0.1°C	Yes
*Resolution (Delta-T):	0.01°C	0.02°C	Yes
Response Time:	10 seconds	≤1 minute	Yes
Relative Humidity – Vaisala Mdl. HMP45AC			
Accuracy:	±2/3% at 0-90/90-100% RH	±1.5°C Dew Point**	Yes
Range:	0.8% to 100% RH	-30°C to +30°C Dew Point**	Yes
*Resolution:	0.1% RH	1% RH	Yes
Response Time:	10 sec	≤30 minutes	Yes
Operating Temperatures:	-40°C to +60°C	-30°C to +30°C	Yes

** EPA criteria in units of dew point, RH and operating temperature ranges meet these criteria.

Parameter (Continued)	Instrument Specifications	EPA Standard	Pass?
Wind Speed – Climatronics Mdl. F460-100075			
Accuracy:	±0.07 m/s or ±1% of obs.	±0.2 m/s + 5% of observed	Yes
Range:	0.0 m/s to 65 m/s	0.5 m/s to 50 m/s	Yes
*Resolution:	0.01m/s	0.1 m/s	Yes
Threshold Speed:	0.22 m/s	≤0.5 m/s	Yes
Distance Constant:	<4.0 m (HD Alum. Cups)	≤5 m	Yes
Operating Temperatures:	-40°C to +60°C	-30°C to + 30°C	Yes
Wind Direction – Climatronics Mdl. F460-100076			
Accuracy:	±2°	±5°	Yes
Range:	0° to 360°	0° to 360°	Yes
*Resolution:	0.1°	1°	Yes
Threshold Speed:	0.22 m/s	≤0.5 m/s	Yes
Distance Constant:	<2.5 m (Heavy Duty Vane)	≤5 m	Yes
Damping Ratio:	>0.4 @10° initial angle	0.4 to 0.7	Yes
Operating Temperatures:	-50°C to +60°C	-30°C to + 30°C	Yes
Wind Speed – RM Young Mdl. 05305 Wind Monitor-AQ			
Accuracy:	±0.2 m/s or 1% of observed	±0.2 m/s + 5% of observed	Yes
Range:	0.0 m/s to 50 m/s	0.5 m/s to 50 m/s	Yes
*Resolution:	0.01m/s	0.1 m/s	Yes
Threshold Speed:	0.4 m/s	≤0.5 m/s	Yes
Distance Constant:	2.1 m	≤5 m	Yes
Operating Temperatures:	-50°C to +50°C	-30°C to + 30°C	Yes
Wind Direction – RM Young Mdl. 05305 Wind Monitor-AQ			
Accuracy:	±3°	±5°	Yes
Range:	0° to 360°	0° to 360°	Yes
*Resolution:	0.1°	1°	Yes
Threshold Speed:	0.5 m/s @10° displacement	≤0.5 m/s	Yes
Distance Constant:	1.2 m	≤5 m	Yes
Damping Ratio:	0.45	0.4 to 0.7	Yes
Operating Temperatures:	-50°C to +50°C	-30°C to + 30°C	Yes
Barometric Pressure – Vaisala Mdl. PTB101B			
Accuracy:	±0.5 mbar	±3 mbar	Yes
Range:	600 mbar to 1060 mbar	Not Specified	N/A
*Resolution:	0.1 mbar	0.5 mbar	Yes
Response Time:	300 msec	Not Specified	N/A
Operating Temperatures:	-40°C to +60°C	Not Specified	N/A
Solar Radiation – LI-COR Mdl. Li-200SX Pyranometer			
Accuracy:	±5% Observed	±5% Observed	Yes
Range:	0 W/m ² to 3000 W/m ²	Not Specified	N/A
*Resolution:	1 W/m ²	10 W/m ²	Yes
Response Time:	10 µs	5 seconds	Yes
Spectral Response:	400 nm to 1,100 nm	285 nm to 2800 nm	No
Operating Temperatures:	-40°C to +65°C	-20°C to +40°C	Yes

Parameter (Continued)	Instrument Specifications	EPA Standard	Pass?
Tipping Precipitation – Met One Mdl. 370-0.2mm			
Accuracy:	±1% of 1-3 in/hr (±0.5mm)	±10% observed or ±0.5 mm	Yes
Range:	0-76 mm/hr (0-3 in/hr)	0-50 mm/hr (0-2 in/hr)	Yes
*Resolution:	0.2 mm	0.3 mm	Yes
Operating Temperatures:	-50°C to +50°C	Not Specified	N/A
Evaporation – NovaLynx Mdl. 255-100/200			
Accuracy:	±0.25% over 10" range	Not Specified	N/A
Range:	2" to 10"	Not Specified	N/A
*Resolution:	0.1 mm	Not Specified	N/A
Operating Temperatures:	0°C to +60°C	Not Specified	N/A

* For all instruments; resolutions are the result of instrument type, configuration and DAS programming.

3.3 Station Location and Sensor Placement

3.3.1 Tower

- Do all obstructions exist below a 1:10 slope away from the tower base? Yes No Comments: None.
- Is the height of the tower at least 10 meters above the ground? Yes No Comments: None.
- Is the tower stable and plumb? Yes No Comments: None.
- Is the tower protected from lightning? Yes No Comments: There is no lighting protection, but area not prone to strikes.

3.3.2 Temperature Sensors

- Are the sensors mounted at least 2-m above open level ground at least 9-m in diameter? Yes No Comments: None.
- Are the temperature difference probes at heights of 2-m and 10-m above the ground? Yes No Comments: None.
- Are the sensors at a distance greater than four times the height of any obstruction? Yes No Comments: None.
- Is the ground beneath the temperature sensors natural native material? Yes No Comments: None.
- Is the site free of any natural features that could bias temperature data (e.g. open water, sloping ridge, etc.)? Yes No Comments: None.
- Is the site free of any man-made features that could bias temperature data (e.g. asphalt, concrete, exhaust plumes, etc.)? Yes No Comments: None.
- Are the sensors located at least 30 meters from large paved areas? Yes No Comments: None.

Pebble 4 PSD Meteorological Station Systems Audit

Owner: NDM

Operator: Dominic Shallies

Alternate: Steve Mackey

Date: Jul 12, 2006

Witnesses: Dominic Shallies

Auditor: Eric Brudie

Is the ambient temperature sensor protected from the influence of solar radiation?

- Yes Comments: Housed in Met One Mdl 076B-4 Motor Aspirated Radiation Shield.
- No

Are the temperature difference sensors located in identical aspirated shields?

- Yes Comments: Housed in Met One Mdl 076B-4 Motor Aspirated Radiation Shields.
- No

3.3.3 Relative Humidity Sensor

Is the relative humidity sensor open to the atmosphere & protected from precipitation?

- Yes Comments: Housed in 2-m aspirated shield with temperature sensor.
- No

3.3.4 Wind Speed and Wind Direction Sensors

Is the horizontal distance between the instruments and any obstruction at least 10 times the height of the obstruction?

- Yes Comments: None.
- No

Are the instruments at least 1.5 times nearby building height(s) above the building roof(s), or 10-m high?

- Yes Comments: None.
- No

Are the wind speed and wind direction sensors stable and plumb?

- Yes Comments: None.
- No

Is the distance of the sensor on the cross-arm at least twice the diameter of the tower?

- Yes Comments: Climatronics Sensors mounted on a crossarm which meets this criterion.
- No

Is the distance of the sensor on the cross-arm at least twice the diameter of the tower?

- Yes Comments: RM Young sensor mounted on an extension arm which meets this criterion.
- No

Is the wind direction sigma theta data being collected according to EPA requirements?

- Yes Comments: DAS calculated using Yamartino method and a one-second scan interval.
- No

3.3.5 Barometric Pressure Sensor

Is the barometric pressure sensor open to atmosphere & protected from precipitation?

- Yes Comments: Housed in unsealed shelter, mounted on the wiring panel.
- No

3.3.6 Solar Radiation Sensor

Is the instrument situated above the plane of any obstructions that could cast shadows?

- Yes Comments: None.
- No

Is the sensor situated south of the tower to minimize obstruction from the tower?

- Yes Comments: None.
- No

3.3.7 Precipitation Gauge

Are all obstructions to the wind farther away from the gauge than the obstruction height?

- Yes Comments: None.
- No

If located in an open and windy area, is a windshield being used?

- Yes Comments: Altar type shield surrounds Met-One gauge.
- No

Is the area surrounding the rain gauge covered by natural vegetation or gravel?

- Yes Comments: None.
- No

Is the instrument mounted at least 30 cm above the ground?

- Yes Comments: None.
- No

Pebble 4 PSD Meteorological Station Systems Audit

Owner: NDM

Operator: Dominic Shallies

Alternate: Steve Mackey

Date: Jul 12, 2006

Witnesses: Dominic Shallies

Auditor: Eric Brudie

Is the instrument mounted level? Yes No Comments: None.

3.3.8 Evaporation Gauge

Is the evaporation pan above the plane of any obstructions that could cast shadows? Yes No Comments: None.

Are the pan and gauge mounted on a stable and level platform? Yes No Comments: Mounted on a 6' x 8' deck supported on adjustable pier blocks.

Is the evaporation pan protected from animals? Yes No Comments: Six-foot fence surrounds evaporation pan and gauge.

4.0 STANDARD OPERATING PROCEDURES

4.1 General

Is the station visited on a preset schedule? Yes No Comments: None.

Have standard SOPs been developed, and are they being followed by the operators? Yes No Comments: None.

Does the operator follow a preventative maintenance schedule? Yes No Comments: None.

Are site visits and maintenance activities properly documented in a Station Log? Yes No Comments: Site visit memos are compiled.

Are station operators knowledgeable and competent regarding effective operation? Yes No Comments: None.

Have operators attended any formal training for operating met monitoring stations? Yes No Comments: The lead operator has formal training and all operators have onsite experience.

Are copies of the NIST certifications for the calibration equipment made available? Yes No Comments: Attached.

4.2 DAS and Meteorological Sensors

Are regular multipoint QC checks performed on the DAS? Yes No Comments: DAS audited by virtue of the instrument output values.

Are regular multipoint QC checks performed on the meteorological sensors? Yes No Comments: None.

Are the sensors visually inspected for defects and problems? Yes No Comments: None.

Are ambient conditions compared with sensor readings from the DAS? Yes No Comments: DAS output compared to Iliamna Airport weather station.

Are data frequently reviewed for reasonableness and completeness? Yes No Comments: None.

Is a copy of the datalogger program made available for review? Yes No Comments: None.

5.0 DOCUMENTATION

5.1 System Reference and Maintenance Manuals

Does the operator have all required DAS and meteorological instrument manuals?

- Yes Comments: On-site and at HCG offices.
 No

Does the operator have configuration and wiring schematics specific to the station?

- Yes Comments: Operator carries wiring schematics.
 No

5.2 Station Monitoring Plan and Report Forms

Is the Monitoring/QA plan comprehensive and reflective of the actual installation?

- Yes Comments: None.
 No

Does the Monitoring/QA plan indicate the intended use for the data collected during the monitoring program?

- Yes Comments: Collect PSD quality data to meet dispersion modeling requirements and satisfy mine/transportation design requirements.
 No

Does the system outlined in the QA plan meet the objectives outlined above?

- Yes Comments: PSD quality installation.
 No

Does the QA Plan indicate the intended schedule for reports to be submitted?

- Yes Comments: None.
 No

Does the station have an activity log?

- Yes Comments: Site visit memos written after each visit to supplant a log book.
 No

Does the station have a formal Site Visit and Checklist Form?

- Yes Comments: No formal checklist used.
 No

Does the station have an adequate Operations Manual?

- Yes Comments: Monitoring/QA plan and equipment manuals.
 No

Does the station have an adequate calibration form and copies of previous audits & cals?

- Yes Comments: None.
 No

Are report forms and site logs properly completed and current?

- Yes Comments: None.
 No

Pebble 4 PSD Meteorological Station Systems Audit

6.0 DATA PROCESSING and VALIDATION

6.1 Overall Data Management

- Diagram the flow of data from monitoring equipment to submission of a final report.

6.2 Data Collection and Initial Data Review

- | | | |
|---|---|---|
| Is the station polled and data downloaded on a regular basis? | <input checked="" type="checkbox"/> Yes | Comments: <u>Daily via RF modem and telephony modem.</u> |
| | <input type="checkbox"/> No | |
| Are the monitoring station data reviewed on a regular basis? | <input checked="" type="checkbox"/> Yes | Comments: <u>Data imported into custom graphs and reviewed 5-6 days per week.</u> |
| | <input type="checkbox"/> No | |
| Are the monitoring station data screened on a regular basis? | <input checked="" type="checkbox"/> Yes | Comments: <u>Data screened using EPA criteria prior to summary compilations.</u> |
| | <input type="checkbox"/> No | |
| Are procedures in place for backing up raw data? | <input checked="" type="checkbox"/> Yes | Comments: <u>Raw data files are backed up on the HCG server and on magnetic tape.</u> |
| | <input type="checkbox"/> No | |
| Are written procedures for data handling available for the project? | <input checked="" type="checkbox"/> Yes | Comments: <u>None.</u> |
| | <input type="checkbox"/> No | |

Pebble 4 PSD Meteorological Station Systems Audit

Owner: NDM

Operator: Dominic Shallies

Alternate: Steve Mackey

Date: Jul 12, 2006

Witnesses: Dominic Shallies

Auditor: Eric Brudie

- Describe the data polling process and initial data evaluation.

Data is downloaded from the station on a daily basis using a dedicated data polling computer located at the HCG office. The raw *.dat file is appended to the existing raw station data file located on the HCG server, which is backed up to tape daily. The raw data are copied to an Access/Excel database file which generates custom graphs of the various meteorological and operational parameters. These graphs are reviewed 5-6 days per week in order to identify station problems. This graphical data review is the frontline of maintaining a complete and defensible dataset. Station upsets are instantly identified and repaired within days. Copies of both the raw unadjusted data and the custom database files are retained for a minimum of 5 years.

6.3 Corrective Actions

Are procedures established for initiating corrective actions during data processing?

Yes Comments: Daily graphical data review and subsequent reactions.
 No

- Describe procedures for initiating, tracking and closing corrective actions.

When nonconformance issues are recognized during graphical review, the Lead Operator/Data Manager plans and executes corrective action. A calibration check is performed on any sensor which is repaired or replaced during the action. A site visit memo outlining the nature of the problem and repairs undertaken is written and saved to the station file. Any quantifiable error is also documented for possible data validation. The Operator/Data Manager ensures the erroneous data are flagged for the period from initial noncompliance until repair and calibration are affected.

6.4 Data Validation

Are data validation procedures established and in use?

Yes Comments: None.
 No

Are adjusted and unadjusted data sets maintained?

Yes Comments: Both are backed up on the HCG server and magnetic tape.
 No

- Describe the initial data validation procedure.

Data is compiled in a custom Excel spreadsheet programmed to evaluate meteorological data against EPA recommended PSD data screening criteria. The data are screened for events such as; extended periods of zero wind speed (indicating icing or worn bearings), temperatures outside of the known monthly max/min for the area, etc. Nonconforming data are flagged by the screening program for further investigation. Also, data periods for individual parameters are flagged for times when the corresponding instrument was undergoing field servicing, calibrations or audits. Periods when instruments are known to have been out of calibration or malfunctioning are also flagged.

- Describe procedures for validating and invalidating flagged data (outliers).

Data flagged during the screening process described above are manually reviewed. If the data have a quantifiable, consistent and documented bias, they may be adjusted and then validated. Specific guidelines are detailed in the Plan. Data which have been flagged by the screening program are also compared to local weather conditions as determined from other sources. Examples where data flagged during screening may be validated include periods when winds were known to have been exceptionally calm at nearby stations or extreme temperatures outside the historical max/min were witnessed. At this point, flagged data are permanently validated and left in the database or invalidated and removed from the database. Data removed from the database are replaced with an alphanumeric code to indicate the reason for invalidation.

Affiliation: Hoefer Consulting Group, Inc.

6.5 Data Capture

- Identify the desired data capture rate for the monitoring data.

Target rate for PSD Quality Meteorological Monitoring Data is 90%.

Is the desired data capture rate being met for each data type?

Yes Comments: None.

No

6.6 Data Reporting

Are quarterly and annual data reports being submitted for the site?

Yes Comments: None.

No

Are qualified staff personnel reviewing data reports prior to submittal?

Yes Comments: None.

No

Is finalized data set submitted with report to ADEC?

Yes Comments: None.

No

7.0 QUALITY ASSURANCE AND QUALITY CONTROL

7.1 Quality Assurance Program

Has a quality assurance plan been written describing quality assurance procedures?

Yes Comments: None.

No

Is a copy of the plan available to field and data processing personnel?

Yes Comments: None.

No

Has the quality assurance plan been approved by the ADEC?

Yes Comments: None.

No

- Identify those person(s) responsible for updating the plan SOPs.

Name: Steve Mackey

Position: Project Manager

Affiliation: Hoefer Consulting Group, Inc.

7.2 Quality Assurance Methods and Audits

Have adequate audit procedures been identified within the quality assurance plan?

Yes Comments: None.

No

Does the Plan correctly document PSD accuracy limits for calibrating and auditing?

Yes Comments: None.

No

Have audits been conducted on the suggested schedule of every six months?

Yes Comments: None.

No

Pebble 4 PSD Meteorological Station Systems Audit

Owner: NDM

Operator: Dominic Shallies

Alternate: Steve Mackey

Date: Jul 12, 2006

Witnesses: Dominic Shallies

Auditor: Eric Brudie

- Identify the person(s) responsible for conducting audits on the monitoring instrumentation.

Name: Eric Brudie

Position: Field Auditor

Affiliation: Hoefer Consulting Group, Inc.

8.0 COMMENTS AND SUGGESTIONS

- Prepare and compile site specific station checklists and visit forms.

**APPENDIX B
PERFORMANCE AUDIT DATA SHEETS and ALIGNMENT MAP**

METEOROLOGICAL STATION - INSTRUMENT PERFORMANCE AUDIT (11-M)

Owner: Northern Dynasty
Auditor: Eric Brudie

Operator: Dominic Shallies
Witness(s): Dominic Shallies

Alternate: Steve Mackey
Station Site: Pebble 4
Audit Date: Jul 12, 2006

• DAS TIME AUDIT

PSD Limits: DAS time = Alaska Standard Time (AST) +/- 5 minutes.

Conversions: Winter; (AST) = (DST), Summer; (AST) = (DST) - 1 hr.

Comments: None.

DAS TIME vs. NOAA CLOCK			
AST Time	DAS Time	Error Min:Sec	Pass/Fail?
11:35:00	11:34:58	-00:02	PASS

• TEMPERATURE SENSORS & AT AUDIT

Lower Height: 2.0 Meters Upper Height: 9.9 Meters

2-M Thermistor:	Make: Met One	Model: 062MP	S.N.#: E2777 # 2/2	Range: -50 to 50 °C

This Instrument was calibrated using Instruments Traceable to National Institute of Standards and Technology.

A Test Uncertainty Ratio of at least 4:1 is maintained unless otherwise stated and is calculated using the expanded measurement uncertainty. Uncertainty evaluation includes the instrument under test and is calculated in accordance with the ISO "Guide to the Expression of Uncertainty in Measurement" (GUM). The uncertainty represents an expanded uncertainty using a coverage factor k=2 to approximate a 95% confidence level. In tolerance conditions are based on test results falling within specified limits with no reduction by the uncertainty of the measurement. The results contained herein relate only to the item calibrated. This certificate shall not be reproduced except in full, without written approval of Control Company.

Nominal=Standard's Reading; As Left=Instrument's Reading; In Tol=In Tolerance; Min/Max=Acceptance Range; ±uc=Measurement Uncertainty; TUR=Test Uncertainty Ratio;
Accuracy=±(Max-Min)/2

Wallace Berry, Technical Manager

Maintaining Accuracy:

In our opinion once calibrated your Digital Thermometer should maintain its accuracy. There is no exact way to determine how long calibration will be maintained. Digital Thermometers change little, if any at all, but can be affected by aging, temperature, shock, and contamination.

Recalibration:

For factory calibration and re-certification traceable to National Institute of Standards and Technology contact Control Company.

CONTROL COMPANY 4455 Rex Road Friendswood, TX 77546 USA

Certificate of Calibration

Report #: 101705-X0740015-RH **RMA #:** 95-49728
Model #: HMI41/HMP45

Instrument Type: Humidity Transmitter

Instrument Range: 0 to 100%RH

Calibration Date: Oct-17-2005
Serial #: X0650080 / X0740015

Calibration Procedure: 11603100

Recommended Calibration Due Date: Oct-17-2006

Customer: HOEFLER CONSULTING GROUP
City, State: ANCHORAGE, AK

This unit was calibrated by adjusting its reading at 0%* against a dry-air line and at 75% against reference humidity and temperature instrument, Vaisala model HMP233. Additional instrument verification checkpoints were made against HMP233 reference at 11%RH, 33%RH and 97%* RH. Calibration and instrument verification sequences utilize a dry-air line and a set of controlled aqueous salt solutions Vaisala model HMK13B. Laboratory ambient conditions are humidity and temperature controlled. The calibration uncertainty is presented at 95% confidence level, k=2. The standard uncertainty of the measurement has been determined in accordance with U.S. Guide to the Expression of Uncertainty in Measurement. *Note: the 0% and 97% RH points are not ISO17025 Accredited.

Action Taken: No Adjustment Was Necessary

The results of this calibration are related only to the items being calibrated, and, are traceable to the National Institute of Standards and Technology through NIST Test Report Number 270953-05, dated Oct. 29, 2004. Vaisala's calibration system has been established to meet the requirements of ANSI/NCSL Z540-1-1994. This certificate can not be reproduced, except in full, without the expressed written consent of Vaisala. The certificate was established to comply with the requirements of ISO/IEC17025. Vaisala is ISO 9001:2000 certified.

STANDARDIZATION OF EPPELEY PRECISION SPECTRAL PYRANOMETER Model PSP

Serial Number: 34377F3

Resistance: 603 Ω at 23 $^{\circ}\text{C}$

Temperature Compensation Range: -20 to 40 $^{\circ}\text{C}$

This radiometer has been compared with Standard Precision Spectral Pyranometer, Serial Number 21231F3 in Eppley's Integrating Hemisphere under radiation intensities of approximately 700 watts meter $^{-2}$ (roughly one-half a solar constant). The adopted calibration temperature is 25 $^{\circ}\text{C}$.

As a result of a series of comparisons, it has been found to have a sensitivity of:

$$9.33 \times 10^{-6} \text{ volts/watts meter}^{-2}$$

The calculation of this constant is based on the fact that the relationship between radiation intensity and emf is rectilinear to intensities of 1400 watts meter $^{-2}$. This radiometer is linear to within $\pm 0.5\%$ up to this intensity.

The calibration of this instrument is traceable to standard self-calibrating cavity pyrheliometers in terms of the Systems Internationale des Unites (SI units), which participated in the Ninth International Pyrheliometric Comparisons (IPC IX) at Davos, Switzerland in September-October 2000.

Useful conversion facts: 1 cal cm $^{-2}$ min $^{-1}$ = 697.3 watts meter $^{-2}$
1 BTU/ft 2 -hr $^{-1}$ = 3.153 watts meter $^{-2}$

1.0 INTRODUCTION

Hoefer Consulting Group, Inc. (HCG) operates meteorological monitoring stations for Northern Dynasty Mines, Inc. (NDM) in support of the Pebble Mine Project near Iliamna, Alaska. The air monitoring program is one component of ongoing baseline environmental studies being conducted to support mine permitting, mine design and mine transportation infrastructure development. The stations meet Prevention of Significant Deterioration (PSD) guidelines, although PSD permits may not be required. This report covers the Pebble 4 Station (Pebble 4) located near the proposed mine site.

Pebble 4 is located approximately five miles south of the mine ore body on top of a windswept knoll at about 1,200 foot elevation. The station consists of an instrumented 11-meter sectional tower secured with three guy wires. Approximately 50 foot south of the tower is an evaporation pan and a tipping precipitation gauge mounted on a 6' by 8' deck. Between the tower and the gauges is a 5' by 7' insulated building which houses the datalogger and power supply system. Pebble 4 is instrumented with PSD quality sensors monitoring the following parameters:

- Ambient Temperature (°C): Met One 062MP Thermistor Probe at 2-m
- Temperature Difference (°C): Met One 062MP Thermistors at 2-m and 10-m
- Relative Humidity (%RH): Vaisala HMP45AC Relative Humidity Sensor
- Wind Speed 1 (m/s): Climatronics F460 P/N 100075 Wind Speed Sensor
- Wind Direction 1 (°): Climatronics F460 P/N 100076 Wind Direction Sensor
- Wind Speed 2 (m/s): RM Young 05305 Wind Monitor-AQ
- Wind Direction 2 (°): RM Young 05305 Wind Monitor-AQ
- Sigma Theta (°): Campbell Scientific CR10X DAS calculated (Yamartino)
- Barometric Pressure (mbar): Vaisala PT101B Barometric Pressure Sensor
- Solar Radiation (W/m²): LI-COR Li-200SX Solar Radiation Pyranometer
- Precipitation 1 (mm H₂O): Met-One Model 370 Tipping Precipitation Gauge
- Precipitation 2 (mm H₂O): ETI Model Noah II Weighing Precipitation Gauge
- Evaporation (mm H₂O): Nova-Lynx Model 255-100/200 Pan and Gauge.

This report has been prepared for NDM to serve as a quantitative review of the Pebble 4 station. To that end, a Performance Audit was undertaken in order to demonstrate that the equipment installed at the meteorological monitoring station is operating correctly and meets the requirements set forth by the U.S. Environmental Protection Agency (EPA) and the Alaska Department of Environmental Conservation (ADEC).

2.0 PERFORMANCE AUDIT

2.1 Performance Audit Methodology

During the performance audit, the station datalogger is interfaced with a portable laptop computer to display the outputs for the meteorological sensors. The value of each meteorological sensor is compared to the output value from the appropriate piece of audit equipment or from calibrated instruments collocated with the sensor. The difference between the station's datalogger reading and the output from each audit instrument is compared with established PSD limits to determine the accuracy of each sensor. Additionally, threshold torques for wind speed and wind direction are measured with audit equipment and compared with manufacturer torques corresponding to the PSD threshold speed of 0.5 m/s. Table 2-1 provides a summary of the performance audit methods and limits used to audit each parameter at the stations.

Table 2-1 Performance Audit Methods and Acceptable Limits

Parameter	Audit Method	EPA/Manufacturer Limit
Datalogger Time	NOAA Clock	$\leq \pm 5:00$ minutes from AST
Temperature Accuracy	Collocated NIST thermistor	$\leq \pm 0.5$ °C
Temperature Difference	Collocated NIST thermistor	$\leq \pm 0.1$ °C
Relative Humidity	Collocated NIST RH sensor	$\leq \pm 1.5$ °C of dew point
Wind Speed Accuracy	Synchronous rpm motor	$\leq \pm 0.2$ m/s + 5 % observed
Wind Spd Torque (Clim)	Torque watch	≤ 0.35 g-cm (0.0049 oz-in)
Wind Spd Torque (RMY)	Torque watch	≤ 1.0 g-cm (0.014 oz-in)
Wind Direction Alignment	GPS, compass or landmark	$\leq \pm 5$ ° from true azimuth
Wind Direction Accuracy	Linearity tester	$\leq \pm 5$ ° per audit point
Wind Direction Linearity	Linearity tester	≤ 3 ° mean absolute average
Wind Dir Torque (Clim)	Torque watch	≤ 7.5 g-cm (0.104 oz-in)
Wind Dir Torque (RMY)	Vane torque gauge	≤ 11 g-cm (0.153 oz-in)
Barometric Pressure	Collocated NIST BP sensor	$\leq \pm 3$ mbar
Solar Radiation	Collocated NIST sensor	$\leq \pm 5\%$ of input+resolution ¹
Precipitation	Calibrated water volume	$\leq \pm 10\%$ of input
Evaporation	Measured water level	$\leq \pm 10\%$ of input

1. This audit limit is modified from PSD standard, as discussed below.

2.1.1 Data Acquisition System

An audit of the datalogger is conducted by comparing all datalogger outputs to the audit standards, as described below. The datalogger time is checked against an instantaneous time reading from the National Oceanic and Atmospheric Administration (NOAA) clock in Boulder, Colorado, via a global positioning system (GPS) handheld unit or telephone contact with the NOAA clock.

2.1.2 Air Temperature and Air Temperature Difference

The 2-meter and 10-meter thermistors are removed from their aspirator shields and collocated with a National Institute of Standards and Technology (NIST) traceable digital thermometer. The station thermistors and the transfer standard NIST thermometer are taped together and immersed in insulated thermoses containing a series of fluid baths; hot water (35°C to 45°C), warm water (15°C to 25°C), water/ice bath (0°C), cold glycol (-15°C to -25°C) and very cold glycol (-35°C to -45°C). Dry ice is used to cool the glycol baths. Each liquid bath is agitated and allowed to equilibrate before simultaneous readings are taken from the three instruments.

An alternate method can also be used for the low temperature audits, employing a Thermal Mass Device (TMD). The TMD consists of a 6" diameter by 9" high solid aluminum block milled to fit snuggly inside of an insulated Dewar flask. On the top of the TMD, and in corresponding locations on the flask lid, are holes sized to accommodate a variety of Campbell, Climatronics, Met-One and VWR thermistors. The TMD is cooled to the target temperatures by contact with dry ice and then placed in the insulated flask. The audit and station thermistors are inserted through the flask lid and into the appropriate holes in the TMD. After the TMD and the thermistors are allowed to equilibrate, readings for all thermistors are simultaneously taken. The aluminum TMD has a very high thermal conductivity and when allowed to equilibrate inside of the insulated flask, thermal gradients across the TMD are very small.

In all cases, the difference between the individual station thermistors and the NIST standard are compared to the PSD temperature accuracy limit of $\pm 0.5^{\circ}\text{C}$. The difference between the two station thermistors (10-m°C minus 2-m°C) is compared to the PSD temperature difference limit of $\pm 0.1^{\circ}\text{C}$.

2.1.3 Relative Humidity

Relative humidity (RH) is audited using a collocated NIST traceable RH sensor. The NIST sensor and the field sensor are collocated out of direct sunlight to eliminate solar radiation effects, preferably inside of the motor aspirated shield. If the NIST standard reads directly in dew point °C, those readings are used; if not, relative humidity and

temperature readings are used. For the audit; instantaneous readings of dew point, relative humidity and ambient temperature are recorded from the transfer standard and the DAS. All relative humidity and temperature readings are converted to dew point in order to assess the PSD error limit of $\pm 1.5^{\circ}\text{C}$ dew point.

2.1.4 Wind Speed

Anemometers are audited to determine their accuracies in reading known wind speeds and to ascertain the sensor's threshold torque. The Climatronics and RM Young sensors are audited in very similar manners and are discussed together. The instruments are tested after removal from the tower and after removal of the sensor's props or cups.

First, an RM Young synchronous motor is attached to the shaft of the anemometer by using brand specific coupling devices. The sensor shaft is rotated at several different known revolutions per minute (rpm). Each rotational speed in rpm is equated to a wind speed in meters per second (m/s) by using the anemometer manufacturer's linear calibration formula. The difference between the calculated input speed in m/s and the datalogger output is compared to established PSD limits for each input rpm.

Next, a high precision torque watch is attached to the shaft of the anemometer, once again using custom couplings. Torque readings are made in both directions in each quadrant along the axis of rotation of the shaft. The maximum reading is recorded for the torque required to turn the shaft of the anemometer. The torque value recorded during the audit is compared to manufacturer's torque corresponding to the minimum PSD threshold speed of 0.5m/s.

2.1.5 Wind Direction

The wind direction sensors are first audited as-found to determine the accuracy of their alignment with respect to true north (true azimuth alignment) using one of four methods. In one method, a handheld GPS unit is used to measure the position of the auditor with respect to a waypoint captured under the wind sensor's position on the tower. Using binoculars, the tail of the wind vane is aligned with the auditor's position at a distance of several hundred feet from the tower. The GPS bearing back to the tower waypoint is then compared to the DAS reading. The difference between the two should not exceed $\pm 5^{\circ}$ per audit point. This procedure is repeated at least 4 times, once per quadrant, generally near the cardinal directions. The second method uses a calibrated precision compass mounted on a gimbal and tripod. The compass declination is preset for the specific location and date using one of a variety of magnetic declination computer models. The sensor tail is aligned toward the auditor while auditor sights the

compass toward the sensor and readings are taken in a similar manner to the GPS method.

Another option is to align the tail of the sensor with a distant identifiable landmark of known bearing. The bearing to the landmark may be ascertained using a variety of methods. One method involves physically capturing a distant GPS waypoint, such as at a discernable structure or emissions stack. Bearings to inaccessible natural landmarks, usually distant mountain peaks, are acquired through the use of various computer mapping programs, such as Natural Geographic's TOPO program or USGS digital raster graphics (DRGs) loaded into AutoCAD. The bearing from the station location to the landmark is compared to the DAS reading. This method yields the most accurate audit value, but is limited by weather and availability of discernable landmarks. The final method is to align the vane with the tower guy wires or preset survey markers, whose bearing has been ascertained using precision survey equipment.

The wind direction accuracy and linearity are subsequently audited after the wind direction sensor is removed from the tower. The Climatronics sensor is mounted on a Climatronics Model 101984 linearity tester and the RM Young sensor is mounted on an RM Young Model 18112 Vane Angle Bench Stand. Both test fixtures are keyed to their respective sensor and graduated from 0° to 360°. A series of readings starting at 30° and then clockwise in 30° increments are taken. The RM Young is read from 30° to 360° and the Climatronics is read from 30° to 540°. The Climatronics sensor is tested 180° past 360° in order to test the second potentiometer used in some DAS programming. Although not required, the Climatronics sensor is also tested with the vane attached in order to ascertain sensor accuracy and linearity relative to the instrument crossarm. The vane is aligned along the axis of the crossarm to yield the 0°/360° and 180° values and against a square held to the crossarm for the 90° and 270° directions. Four readings are taken in a clockwise direction and four are taken counterclockwise to complete the test. For both the linearity test fixture and crossarm tests, individual error values are assessed for the PSD accuracy limit of ±5° per point and the mean absolute average error is assessed against the linearity limit of 3°.

Next, the RM Young wind direction threshold is tested by measuring wind vane torque using an RM Young Model 18331 Vane Torque Gauge. This device saddles the wind vane and a calibrated spring is pulled to determine maximum torque from readings taken in both directions in all four quadrants. The Climatronics wind direction starting torque is measured with the vane removed by using a precision torque watch in the same manner as the wind speed torque. The highest torque readings are compared to specific manufacturer limits for instrument starting torque.

Finally, the wind direction sensors are placed back on the tower and as-left audits of the azimuth alignments are conducted to ensure the instruments are properly reinstalled.

2.1.6 Barometric Pressure

Barometric pressure (BP) is audited using a collocated NIST traceable BP sensor. The difference between the NIST sensor and the station sensor are compared to the PSD limit of ± 3 mbar.

2.1.7 Solar Radiation

Outputs of the station sensor are compared to the output of a level collocated audit solar radiation sensor. The audit sensor is connected to an independent audit datalogger with the scan interval and clock synchronized with the station DAS. Hourly average solar radiation readings and instantaneous readings are recorded during the audit and then input into a custom spreadsheet to calculate a linear regression for the data. The PSD limit for solar radiation audits is $\pm 5\%$ of observed, but this standard is very difficult to obtain at the northern latitude of this installation. This EPA standard is currently undergoing review and is expected to change. A well accepted substitute is that individual DAS and audit data pairs are compared to a limit of $\pm 5\%$ of observed + **EPA minimum instrument resolution ($10W/m^2$)**. Individual data pairs are evaluated against this standard, but the overall set is restricted to a 5% error by limiting allowable linear slope to 1.0 ± 0.05 .

2.1.8 Precipitation

The Met-One tipping precipitation gauge is audited by slowly adding precisely measured volumes of water to the gauge using a dripping Nova Lynx Model 260-2595 Rain Gauge Calibrator. The predicted millimeters of precipitation corresponding to the measured volume added are calculated using the diameter of the gauge opening. The tare reading from the DAS is initially recorded and subsequent DAS readings are recorded after each test run. The percent difference between the predicted audit value and the DAS value is compared to the PSD limit of $\pm 10\%$.

2.1.9 Evaporation

The evaporation gauge is first checked to confirm that the pan and gauge are level. The accuracy is checked by first removing or adding enough water to bring the initial level to approximately 50 mm or 240 mm, the minimum and maximum for this gauge. An accurate millimeter scale is taped to the inside of the evaporation pan and the water level on the scale is compared to the DAS output. Water is added to or removed from the pan to change the level by 10-20mm and another set of readings are taken. This process is repeated until the level in the pan reaches the upper or lower limit of the

gauge. The resultant suite of DAS and scaled water level readings are then input into a custom spreadsheet which calculates a linear regression for the data. The evaporation gauge reads change in water level due to evaporation and rainfall, so the calculated intercept must be removed from measured water levels. The adjusted level is compared to the DAS output with a maximum allowable error of $\pm 10\%$ of input and the slope of resultant line has a limit of 1.0 ± 0.1 .

2.2 Performance Audit Results

The performance audit was conducted at the Pebble 4 station on January 18, 2007, with Dominic Shallies of HCG assisting. Supplemental audits of some instruments were performed during October of 2006. On October 11, 2006 the evaporation pan and precipitation gauge were audited prior to winterization. All sensors were challenged with certified audit equipment and yielded errors below the PSD limits. Table 2-2 contains summary data from the January 2007 audit and Table 2-3 summarizes the supplemental performance audit. Complete audit reports and audit equipment calibration certificates are contained in Appendix A and Appendix B respectively.

2.3 Performance Audit Recommendations

- None.

Table 2-2 Pebble 4 January 18, 2007 Performance Audit Summary

This Instrument was calibrated using Instruments Traceable to National Institute of Standards and Technology.

A Test Uncertainty Ratio of at least 4:1 is maintained unless otherwise stated and is calculated using the expanded measurement uncertainty. Uncertainty evaluation includes the instrument under test and is calculated in accordance with the ISO "Guide to the Expression of Uncertainty in Measurement" (GUM). The uncertainty represents an expanded uncertainty using a coverage factor k=2 to approximate a 95% confidence level. In tolerance conditions are based on test results falling within specified limits with no reduction by the uncertainty of the measurement. The results contained herein relate only to the item calibrated. This certificate shall not be reproduced except in full, without written approval of Control Company.

Nominal=Standard's Reading; As Left=Instrument's Reading; In Tol=In Tolerance; Min/Max=Acceptance Range; ±uc=Measurement Uncertainty; TUR=Test Uncertainty Ratio;
Accuracy=±(Max-Min)/2

Wallace Berry, Technical Manager

Maintaining Accuracy:

In our opinion once calibrated your Digital Thermometer should maintain its accuracy. There is no exact way to determine how long calibration will be maintained. Digital Thermometers change little, if any at all, but can be affected by aging, temperature, shock, and contamination.

Recalibration:

For factory calibration and re-certification traceable to National Institute of Standards and Technology contact Control Company.

CONTROL COMPANY 4455 Rex Road Friendswood, TX 77546 USA

Control Company is an ISO 17025 Calibration Laboratory Accredited by (A2LA) American Association for Laboratory Accreditation, Certificate No. 1750.01.
Control Company is ISO 9001 Quality Certified by (DNV) Det Norske Veritas, Certificate No. CERT-01805-AQ-HOU.
International Laboratory Accreditation Cooperation (ILAC) - Multilateral Recognition Arrangement (MRA).

Certificate of Calibration

Report #: 112006-X0740015-RH RMA #: 95-56707

Model #: HMI41/HMP45

Instrument Type: Humidity Transmitter

Instrument Range: 0 to 100%RH, -20 to 60°C, Temp.

Calibration Date: Nov-20-2006

Serial #: X0650080/X0740015

Calibration Procedure: 11603100

Recommended Calibration Due Date: Nov-20-2007

Customer: HOEFLER CONSULTING GROUP

City, State: ANCHORAGE, AK USA

This unit was calibrated by adjusting its reading at 0%* against a dry-air line and at 75% RH against reference humidity and temperature instrument, Vaisala model HMP233. Additional instrument verification checkpoints were made against HMP233 reference at 11% and 97%* RH. Calibration and instrument verification sequences utilize a dry-air line and a set of controlled aqueous salt solutions Vaisala model HMK13B. Laboratory ambient conditions are humidity and temperature controlled. The calibration uncertainty is presented at 95% confidence level, k=2. The standard uncertainty of the measurement has been determined in accordance with U.S. Guide to the Expression of Uncertainty in Measurement
 *Note: the 0% and 97% RH points are not ISO17025 Accredited

Action Taken: The Unit Was Calibrated

The results of this calibration are related only to the items being calibrated, and, are traceable to the National Institute of Standards and Technology through NIST Test Report Number TN 274176, dated Oct. 2006. Vaisala's calibration system has been established to meet the requirements of ANSI/NCSL Z540-1-1994. This certificate can not be reproduced, except in full, without the expressed written consent of Vaisala. The certificate was established to comply with the requirements of ISO/IEC17025. Vaisala is ISO 9001:2000 certified.

**STANDARDIZATION
OF
EPPLEY PRECISION SPECTRAL PYRANOMETER
Model PSP**

Serial Number: 34377F3

Resistance: 603 Ω at 23 °C

Temperature Compensation Range: -20 to 40 °C

This radiometer has been compared with Standard Precision Spectral Pyranometer, Serial Number 21231F3 in Eppley's Integrating Hemisphere under radiation intensities of approximately 700 watts meter⁻² (roughly one-half a solar constant). The adopted calibration temperature is 25 °C.

As a result of a series of comparisons, it has been found to have a sensitivity of:

$$9.29 \times 10^{-6} \text{ volts/watts meter}^{-2}$$

The calculation of this constant is based on the fact that the relationship between radiation intensity and emf is rectilinear to intensities of 1400 watts meter⁻². This radiometer is linear to within $\pm 0.5\%$ up to this intensity.

The calibration of this instrument is traceable to standard self-calibrating cavity pyrheliometers in terms of the Systems Internationale des Unites (SI units), which participated in the Ninth International Pyrheliometric Comparisons (IPC IX) at Davos, Switzerland in September-October 2000.

Useful conversion facts: 1 cal cm⁻² min⁻¹ = 697.3 watts meter⁻²
1 BTU/ft²-hr⁻¹ = 3.153 watts meter⁻²

1.0 INTRODUCTION

Hoe~~f~~ler Consulting Group, Inc. (HCG) operates meteorological monitoring stations for Northern Dynasty Mines, Inc. (NDM) in support of the Pebble Mine Project near Iliamna, Alaska. The air monitoring program is one component of ongoing baseline environmental studies being conducted to support mine permitting, mine design and mine transportation infrastructure development. The stations meet Prevention of Significant Deterioration (PSD) guidelines, although PSD permits may not be required. This report covers the Pebble 4 Station (Pebble 4) located near the proposed mine site.

Pebble 4 is located approximately five miles south of the mine ore body on top of a windswept knoll at about 1,200 foot elevation. The station consists of an instrumented 11-meter sectional tower secured with three guy wires. Approximately 50 foot south of the tower is an evaporation pan and a tipping precipitation gauge mounted on a 6' by 8' deck. Between the tower and the gauges is a 5' by 7' insulated building which houses the datalogger and power supply system. Pebble 4 is instrumented with PSD quality sensors monitoring the following parameters:

- Ambient Temperature (°C): Met One 062MP Thermistor Probe at 2-m
- Temperature Difference (°C): Met One 062MP Thermistors at 2-m and 10-m
- Relative Humidity (%RH): Vaisala HMP45AC Relative Humidity Sensor
- Wind Speed 1 (m/s): Climatronics F460 P/N 100075 Wind Speed Sensor
- Wind Direction 1 (°): Climatronics F460 P/N 100076 Wind Direction Sensor
- Wind Speed 2 (m/s): RM Young 05305 Wind Monitor-AQ
- Wind Direction 2 (°): RM Young 05305 Wind Monitor-AQ
- Sigma Theta (°): Campbell Scientific CR10X DAS calculated (Yamartino)
- Barometric Pressure (mbar): Vaisala PT101B Barometric Pressure Sensor
- Solar Radiation (W/m²): LI-COR Li-200SX Solar Radiation Pyranometer
- Precipitation (mm H₂O): Met-One Model 370 Tipping Precipitation Gauge
- Evaporation (mm H₂O): Nova-Lynx Model 255-100/200 Pan and Gauge.

This report has been prepared for NDM to serve as an official review of the Pebble 4 station and a review of the overall Pebble Project Meteorological Monitoring Program. To that end, Systems and Performance Audits were undertaken in order to help demonstrate that the equipment and procedures used for collecting meteorological data by HCG meet the requirements set forth by the U.S. Environmental Protection Agency (EPA) and the Alaska Department of Environmental Conservation (ADEC).

2.0 SYSTEMS AUDIT

2.1 Systems Audit Methodology

In the *Quality Assurance Handbook for Air Pollution Measurement Systems* and the *Meteorological Monitoring Guidance for Regulatory Modeling Applications*, EPA provides guidance for conducting systems audits. EPA recommends that a systems audit be conducted to serve as a qualitative review of all aspects of a meteorological monitoring program. The systems audit includes a review of the program plan, station site, facilities, equipment, personnel, procedures, record keeping, data validation and data reporting. The systems audit should be completed within the first 30 days of operation and every year thereafter.

The *Quality Assurance Project Plan for the Pebble Project Meteorological Monitoring Program* was completed by HCG in August 2006. This systems audit consisted of a review of the plan, site visits and personnel interviews. Personnel were also observed during station maintenance and calibration operations. All aspects of the program not specifically mentioned in the Plan were reviewed to determine consistency with EPA and ADEC guidelines. The complete systems audit report contained in Appendix A is organized into six major sections; 1) General Program Information, 2) Monitoring Program Staff Organization, 3) Meteorological Monitoring Station Equipment, 4) Standard Operating Procedures, 5) Documentation, 6) Data Processing and Validation, 7) Quality Assurance and Quality Control (QA/QC), and 8) Comments and Suggestions. Each section consists of a question and answer format with additional comments to provide clarity. Flow charts are also used to accurately document program staff organization and the data handling process. A complete list of the references used for the systems audit is contained in Section 4.

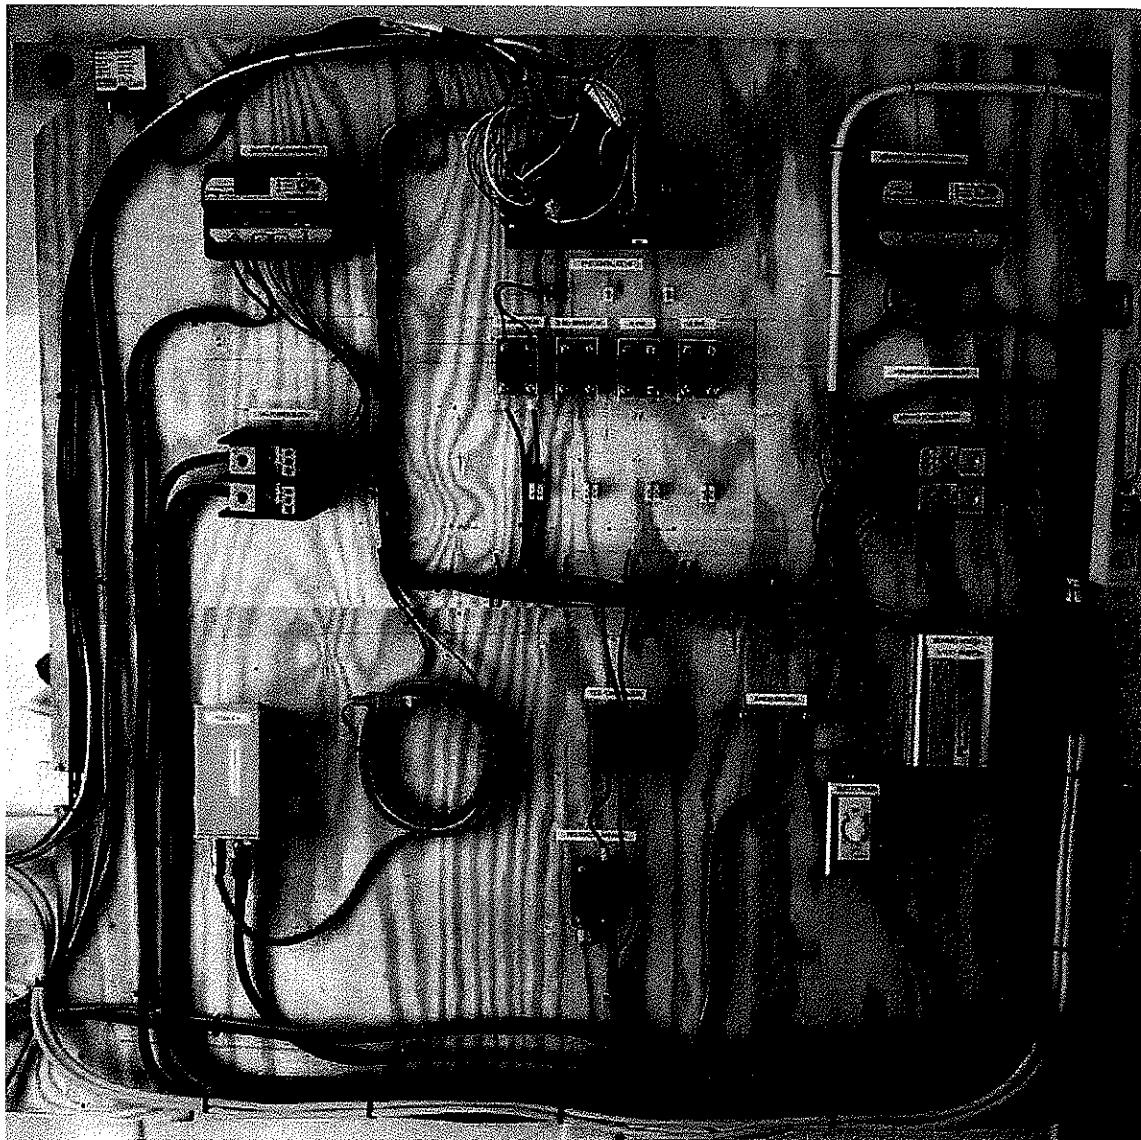

2.2 Meteorological Station Onsite Systems Audit

The on-site systems audit of the Pebble 4 station was conducted in early September 2007. Eric Brudie of HCG completed the systems audit with Dominic Shallies of HCG assisting and witnessing. Mr. Brudie serves as an independent auditor on this project and is not involved with day to day operations of the station.

The Pebble 4 meteorological monitoring station is founded on a stable, well anchored tower with PSD quality sensors securely affixed. The evaporation pan, evaporation gauge and a tipping precipitation gauge are mounted on a 6' by 8' deck supported on four adjustable pier blocks, which allow leveling. The evaporation deck is surrounded by a 6' high fence and all instrumentation wires from the tower, precipitation gauge and evaporation gauge are protected in conduit. These conduits all converge at a 5' by 7'

insulated prefab building. The data acquisition system (DAS), communications system, solar controllers and power distribution system are mounted on a 4' by 4' plywood wiring panel mounted in the building, see photo.

Figure 2-1 Pebble 4 Station DAS Wiring Panel

The Campbell Scientific CR10X/CR1000 DAS wiring is well organized and needs no further discussion. Constant communication between the DAS and a dedicated polling computer in the HCG office is integral to this installation. FreeWave spread spectrum radio modems transmit the signal to a SixNet industrial phone modem which is linked to the grid in Iliamna. The met station radio and base radio rely on directional Yagi antennas focused on an omni-directional antenna at the repeater radio. The repeater

radio is powered by one 70-Watt solar panel buffered through a solar controller and five 100 Amp-Hr deep cycle gel cell batteries.

Power generation at the meteorological monitoring station consists of three 70-Watt solar panels and a Global Thermoelectric Generator (TEG). One solar panel is dedicated to the DAS and meteorological instrumentation; wired through a solar controller and buffered through two 200 Amp-Hr deep cycle gel cell batteries. Two solar panels are dedicated to the aspirator fans, Climatronics bearing heaters, shelter lighting and 120VAC power; also wired through a solar controller and buffered through two 200 Amp-Hr deep cycle gel cell batteries. The shelter lights and 120VAC inverter for laptop use are routed through manual timers to ensure use only when operators are on site. During the winter months, November through April, the TEG is turned on to supplement the power system. The TEG power is routed through relays wired to the DAS control ports which isolate the critical DAS/sensor system during upset conditions. Climatronics heaters are also controlled through relays programmed to limit heater use to weather conditions conducive to icing. All system battery voltages are monitored by the DAS and the thermistor aspirator fans are wired through a current shunt in order to monitor fan operation.

2.3 Operations, Data Management and Documentation Systems Audit

This phase of the systems audit consists of a review of the HCG *Quality Assurance Project Plan for the Pebble Project Meteorological Monitoring Program* (Plan), and other system documentation, and a review of system operations. System operations include physically running the station and subsequent data management.

The Plan is a comprehensive document which adequately details the Pebble meteorological monitoring program. Program objectives, installations, operations, data management and quality assurance are all clearly outlined. Equally, the Pebble 4 station is representative of the Plan design. The Plan provides standard operating procedures and standard forms for all equipment field calibrations and audits. Station operators also had complete DAS and meteorological sensor manuals on hand at the station. Plan and documentation review are covered further in Appendix A.

Station operators were observed during calibration and maintenance procedures and appeared knowledgeable about all facets of operating the monitoring station. Data are downloaded daily using an automated script on a dedicated polling computer located at the HCG office. The raw data are appended to a station file located on the HCG server, which is backed up daily. The data manager copies the raw data to a custom Access/Excel database, leaving the raw data unaltered. The custom database creates

a series of graphs of all meteorological data as well as some station operational parameters. These plots are reviewed 5-6 days per week in order to immediately identify station upsets. An example is a graph of solar radiation and battery voltage; which reveals potential problems with daily charge cycles. Both the Climatronics and RM Young Wind sensor data are plotted together to indicate problems with one of the sensors. All station parameters are plotted with ranges and pairings intended to best reveal upset conditions. Problems are immediately identified and corrective action planned and executed. Steps are taken to flag data which may have been identified as suspect during this graphical data review. Data generated during station maintenance, audits and calibrations are also flagged as invalid.

Prior to compilation of data summary reports, data are screened using EPA recommended screening criteria. Data flagged as outliers by the screening program are further reviewed for consistency with prevailing conditions and then permanently invalidated or validated. Data ultimately invalidated are permanently removed from the database and the reasoning is codified in a special column in the database. This cleaned dataset is used for all subsequent data summaries, wind roses, data reports and capture rate calculations. More detailed discussion of the operations and data management are contained in the Systems Audit Appendix A.

2.4 Comments and Suggestions

The Pebble 4 station is a well designed and operated meteorological monitoring station. During the recent audit the operator upgraded the data acquisition system and added current shunts to the system in order to remotely monitor the aspirator fans. The remote station is equipped with a robust and sophisticated power supply which is constantly monitored. The systems audit revealed that HCG possesses the necessary organization, personnel, training, equipment, quality assurance, and quality control procedures to accurately collect and report PSD quality data. HCG adequately maintains the Pebble 4 station and practices sufficient data review and preventive maintenance to avoid unnecessary data loss.

The following recommendations are made to the program in order to improve the operation of the stations and ensure their operation is in accordance with standards:

- Create custom site visit procedural and inventory checklists
- Keep files on site containing copies of previous visit checklists
- Always use paper calibration forms as well as computer entered forms.

3.0 PERFORMANCE AUDIT

3.1 Performance Audit Methodology

During the performance audit, the station datalogger is interfaced with a portable laptop computer to display the outputs for the meteorological sensors. The value of each meteorological sensor is compared to the output value from the appropriate piece of audit equipment or from calibrated instruments collocated with the sensor. The difference between the station's datalogger reading and the output from each audit instrument is compared with established PSD limits to determine the accuracy of each sensor. Additionally, threshold torques for wind speed and wind direction are measured with audit equipment and compared with manufacturer torques corresponding to the PSD threshold speed of 0.5 m/s. Table 3-1 provides a summary of the performance audit methods and limits used to audit each parameter at the stations.

Table 3-1 Performance Audit Methods and Acceptable Limits

Parameter	Audit Method	EPA/Manufacturer Limit
Datalogger Time	NOAA Clock	$\leq \pm 5:00$ minutes from AST
Temperature Accuracy	Collocated NIST thermistor	$\leq \pm 0.5$ °C
Temperature Difference	Collocated NIST thermistor	$\leq \pm 0.1$ °C
Relative Humidity	Collocated NIST RH sensor	$\leq \pm 1.5$ °C of dew point
Wind Speed Accuracy	Synchronous rpm motor	$\leq \pm 0.2$ m/s + 5 % observed
Wind Spd Torque (Clim)	Torque watch	≤ 0.35 g-cm (0.0049 oz-in)
Wind Spd Torque (RMY)	Torque watch	≤ 1.0 g-cm (0.014 oz-in)
Wind Direction Alignment	GPS, compass or landmark	$\leq \pm 5$ ° from true azimuth
Wind Direction Accuracy	Linearity tester	$\leq \pm 5$ ° per audit point
Wind Direction Linearity	Linearity tester	≤ 3 ° mean absolute average
Wind Dir Torque (Clim)	Torque watch	≤ 7.5 g-cm (0.104 oz-in)
Wind Dir Torque (RMY)	Vane torque gauge	≤ 11 g-cm (0.153 oz-in)
Barometric Pressure	Collocated NIST BP sensor	$\leq \pm 3$ mbar
Solar Radiation	Collocated NIST sensor	$\leq \pm 5\%$ of input+resolution ¹
Precipitation	Calibrated water volume	$\leq \pm 10\%$ of input
Evaporation	Measured water level	$\leq \pm 10\%$ of input

1. This audit limit is modified from PSD standard, as discussed below.

3.1.1 Data Acquisition System

An audit of the datalogger is conducted by comparing all datalogger outputs to the audit standards, as described below. The datalogger time is checked against an instantaneous time reading from the National Oceanic and Atmospheric Administration (NOAA) clock in Boulder, Colorado, via a global positioning system (GPS) handheld unit or telephone contact with the NOAA clock.

3.1.2 Air Temperature and Air Temperature Difference

The 2-meter and 10-meter thermistors are removed from their aspirator shields and collocated with a National Institute of Standards and Technology (NIST) traceable digital thermometer. The station thermistors and the transfer standard NIST thermometer are taped together and immersed in insulated thermoses containing a series of fluid baths; hot water (35°C to 45°C), warm water (15°C to 25°C), water/ice bath (0°C), cold glycol (-15°C to -25°C) and very cold glycol (-35°C to -45°C). Dry ice is used to cool the glycol baths. Each liquid bath is agitated and allowed to equilibrate before simultaneous readings are taken from the three instruments.

An alternate method can also be used for the low temperature audits, employing a Thermal Mass Device (TMD). The TMD consists of a 6" diameter by 9" high solid aluminum block milled to fit snuggly inside of an insulated Dewar flask. On the top of the TMD, and in corresponding locations on the flask lid, are holes sized to accommodate a variety of Campbell, Climatronics, Met-One and VWR thermistors. The TMD is cooled to the target temperatures by contact with dry ice and then placed in the insulated flask. The audit and station thermistors are inserted through the flask lid and into the appropriate holes in the TMD. After the TMD and the thermistors are allowed to equilibrate, readings for all thermistors are simultaneously taken. The aluminum TMD has a very high thermal conductivity and when allowed to equilibrate inside of the insulated flask, thermal gradients across the TMD are very small.

In all cases, the difference between the individual station thermistors and the NIST standard are compared to the PSD temperature accuracy limit of $\pm 0.5^{\circ}\text{C}$. The difference between the two station thermistors (10-m°C minus 2-m°C) is compared to the PSD temperature difference limit of $\pm 0.1^{\circ}\text{C}$.

3.1.3 Relative Humidity

Relative humidity (RH) is audited using a collocated NIST traceable RH sensor. The NIST sensor and the field sensor are collocated out of direct sunlight to eliminate solar radiation effects, preferably inside of the motor aspirated shield. If the NIST standard reads directly in dew point °C, those readings are used; if not, relative humidity and

temperature readings are used. For the audit, instantaneous readings of dew point, relative humidity and ambient temperature are recorded from the transfer standard and the DAS. All relative humidity and temperature readings are converted to dew point in order to assess the PSD error limit of $\pm 1.5^{\circ}\text{C}$ dew point.

3.1.4 Wind Speed

Anemometers are audited to determine their accuracies in reading known wind speeds and to ascertain the sensor's threshold torque. The Climatronics and RM Young sensors are audited in very similar manners and are discussed together. The instruments are tested after removal from the tower and after removal of the sensor's props or cups.

First, an RM Young synchronous motor is attached to the shaft of the anemometer by using brand specific coupling devices. The sensor shaft is rotated at several different known revolutions per minute (rpm). Each rotational speed in rpm is equated to a wind speed in meters per second (m/s) by using the anemometer manufacturer's linear calibration formula. The difference between the calculated input speed in m/s and the datalogger output is compared to established PSD limits for each input rpm.

Next, a high precision torque watch is attached to the shaft of the anemometer, once again using custom couplings. Torque readings are made in both directions in each quadrant along the axis of rotation of the shaft. The maximum reading is recorded for the torque required to turn the shaft of the anemometer. The torque value recorded during the audit is compared to manufacturer's torque corresponding to the minimum PSD threshold speed of 0.5m/s.

3.1.5 Wind Direction

The wind direction sensors are first audited as-found to determine the accuracy of their alignment with respect to true north (true azimuth alignment) using one of four methods. In one method, a handheld GPS unit is used to measure the position of the auditor with respect to a waypoint captured under the wind sensor's position on the tower. Using binoculars, the tail of the wind vane is aligned with the auditor's position at a distance of several hundred feet from the tower. The GPS bearing back to the tower waypoint is then compared to the DAS reading. The difference between the two should not exceed $\pm 5^{\circ}$ per audit point. This procedure is repeated at least 4 times, once per quadrant, generally near the cardinal directions. The second method uses a calibrated precision compass mounted on a gimbal and tripod. The compass declination is preset for the specific location and date using one of a variety of magnetic declination computer models. The sensor tail is aligned toward the auditor while auditor sights the

compass toward the sensor and readings are taken in a similar manner to the GPS method.

Another option is to align the tail of the sensor with a distant identifiable landmark of known bearing. The bearing to the landmark may be ascertained using a variety of methods. One method involves physically capturing a distant GPS waypoint, such as at a discernable structure or emissions stack. Bearings to inaccessible natural landmarks, usually distant mountain peaks, are acquired through the use of various computer mapping programs, such as Natural Geographic's TOPO program or USGS digital raster graphics (DRGs) loaded into AutoCAD. The bearing from the station location to the landmark is compared to the DAS reading. This method yields the most accurate audit value, but is limited by weather and availability of discernable landmarks. The final method is to align the vane with the tower guy wires or preset survey markers, whose bearing has been ascertained using precision survey equipment.

The wind direction accuracy and linearity are subsequently audited after the wind direction sensor is removed from the tower. The Climatronics sensor is mounted on a Climatronics Model 101984 linearity tester and the RM Young sensor is mounted on an RM Young Model 18112 Vane Angle Bench Stand. Both test fixtures are keyed to their respective sensor and graduated from 0° to 360°. A series of readings starting at 30° and then clockwise in 30° increments are taken. The RM Young is read from 30° to 360° and the Climatronics is read from 30° to 540°. The Climatronics sensor is tested 180° past 360° in order to test the second potentiometer used in some DAS programming. Although not required, the Climatronics sensor is also tested with the vane attached in order to ascertain sensor accuracy and linearity relative to the instrument crossarm. The vane is aligned along the axis of the crossarm to yield the 0°/360° and 180° values and against a square held to the crossarm for the 90° and 270° directions. Four readings are taken in a clockwise direction and four are taken counterclockwise to complete the test. For both the linearity test fixture and crossarm tests, individual error values are assessed for the PSD accuracy limit of ±5° per point and the mean absolute average error is assessed against the linearity limit of 3°.

Next, the RM Young wind direction threshold is tested by measuring wind vane torque using an RM Young Model 18331 Vane Torque Gauge. This device saddles the wind vane and a calibrated spring is pulled to determine maximum torque from readings taken in both directions in all four quadrants. The Climatronics wind direction starting torque is measured with the vane removed by using a precision torque watch in the same manner as the wind speed torque. The highest torque readings are compared to specific manufacturer limits for instrument starting torque.

Finally, the wind direction sensors are placed back on the tower and as-left audits of the azimuth alignments are conducted to ensure the instruments are properly reinstalled.

3.1.6 Barometric Pressure

Barometric pressure (BP) is audited using a collocated NIST traceable BP sensor. The difference between the NIST sensor and the station sensor are compared to the PSD limit of ± 3 mbar.

3.1.7 Solar Radiation

Outputs of the station sensor are compared to the output of a level collocated audit solar radiation sensor. The audit sensor is connected to an independent audit datalogger with the scan interval and clock synchronized with the station DAS. Hourly average solar radiation readings and instantaneous readings are recorded during the audit and then input into a custom spreadsheet to calculate a linear regression for the data. The PSD limit for solar radiation audits is $\pm 5\%$ of observed, but this standard is very difficult to obtain at the northern latitude of this installation. This EPA standard is currently undergoing review and is expected to change. A well excepted substitute is that individual DAS and audit data pairs are compared to a limit of $\pm 5\%$ of observed + **EPA minimum instrument resolution (10W/m^2)**. Individual data pairs are evaluated against this standard, but the overall set is restricted to a 5% error by limiting allowable linear slope to 1.0 ± 0.05 .

3.1.8 Precipitation

The Met-One tipping precipitation gauge is audited by slowly adding precisely measured volumes of water to the gauge using a dripping Nova Lynx Model 260-2595 Rain Gauge Calibrator. The predicted millimeters of precipitation corresponding to the measured volume added are calculated using the diameter of the gauge opening. The tare reading from the DAS is initially recorded and subsequent DAS readings are recorded after each test run. The percent difference between the predicted audit value and the DAS value is compared to the PSD limit of $\pm 10\%$.

3.1.9 Evaporation

The evaporation gauge is first checked to confirm that the pan and gauge are level. The accuracy is checked by first removing or adding enough water to bring the initial level to approximately 50 mm or 240 mm, the minimum and maximum for this gauge. An accurate millimeter scale is taped to the inside of the evaporation pan and the water level on the scale is compared to the DAS output. Water is added to or removed from the pan to change the level by 10-20mm and another set of readings are taken. This process is repeated until the level in the pan reaches the upper or lower limit of the

gauge. The resultant suite of DAS and scaled water level readings are then input into a custom spreadsheet which calculates a linear regression for the data. The evaporation gauge reads change in water level due to evaporation and rainfall, so the calculated intercept must be removed from measured water levels. The adjusted level is compared to the DAS output with a maximum allowable error of $\pm 10\%$ of input and the slope of resultant line has a limit of 1.0 ± 0.1 .

3.2 Performance Audit Results

The performance audits were conducted at the Pebble 4 station from September 5-7, 2007, with Dominic Shallies of HCG assisting. The station was audited as found on September 5-6, 2007. After the initial audit the datalogger was upgraded from a Campbell Scientific CR10X to a CR1000 and the RM Young and Climatronics wind direction sensors were replaced. After these modifications the station was re-audited on September 6-7, 2007. All sensors were challenged with certified audit equipment and yielded errors below the PSD limits. Summary audit results are contained in Tables 3-2 and 3-3, and complete audit reports and audit equipment calibration certificates are contained in Appendix B and Appendix C respectively.

3.3 Performance Audit Recommendations

- None.

Table 3-2 Pebble 4 September 5-6, 2007 Performance Audit Summary (CR10X)

Parameter	Limit	Units	Max Err	Status
Datalogger Time	$\leq \pm 5:00$	Min:Sec	-0:24	Pass
2-m Temperature Accuracy	$\leq \pm 0.5$	°C	0.12	Pass
10-m Temperature Accuracy	$\leq \pm 0.5$	°C	0.12	Pass
Air Temperature Difference	$\leq \pm 0.1$	°C	0.05	Pass
Relative Humidity (dew point)	$\leq \pm 1.5$	°C	1.0	Pass
Climatronics Wind System				
Wind Speed Torque	≤ 0.0049	oz-in	<0.003	Pass
Low Wind Spd. Accuracy ($\leq 5\text{m/s}$)	$\leq \pm 0.2$	m/s	0.00	Pass
High Wind Spd. Accuracy ($> 5\text{m/s}$)	$\leq \pm 5$	% input	0.0	Pass
Wind Direction Torque	≤ 0.104	oz-in	0.060	Pass
Wind Dir. Azim. Align. (as-found)	$\leq \pm 5$	Degree	4.3	Pass
Wind Direction Accuracy	$\leq \pm 5$	Degree	2.4	Pass
Wind Direction Linearity	≤ 3	Degree	1.1	Pass
Wind Dir. Azim. Align. (as-left)	$\leq \pm 5$	Degree	N/A ¹	N/A
RM Young Wind System				
Wind Speed Torque	≤ 0.014	oz-in	0.008	Pass
Low Wind Spd. Accuracy ($\leq 5\text{m/s}$)	$\leq \pm 0.2$	m/s	0.00	Pass
High Wind Spd. Accuracy ($> 5\text{m/s}$)	$\leq \pm 5$	% input	0.0	Pass
Wind Direction Torque	≤ 11	g-cm	10.0	Pass
Wind Dir. Azim. Align. (as-found)	$\leq \pm 5$	Degree	4.5	Pass
Wind Direction Accuracy	$\leq \pm 5$	Degree	3.5	Pass
Wind Direction Linearity	≤ 3	Degree	1.5	Pass
Wind Dir. Azim. Align. (as-left)	$\leq \pm 5$	Degree	N/A ¹	N/A
Barometric Pressure	$\leq \pm 3$	Mbar	1.8	Pass

Auditor: Eric Brudie

1.0 GENERAL PROGRAM INFORMATION

1.1 Site Description

The Pebble 4 station is located on the crest of a knoll approximately 5 miles south of the mine ore body. The site is windswept and treeless with very little organics and virtually no obstructions around the station.

1.2 Site Location

1.2.1 Coordinates

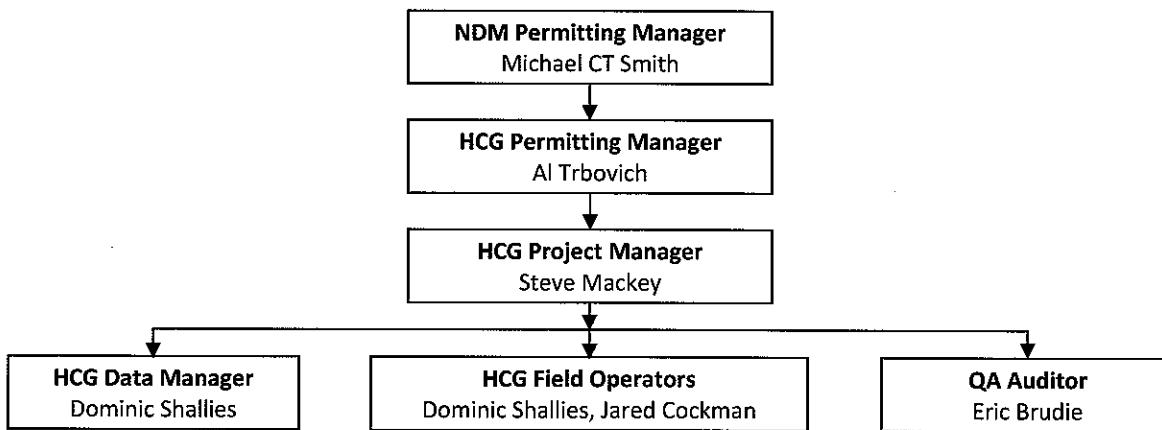

Indicated by Operator	Determined by Auditor
59° 50' N	59° 49.837 N
155° 18' W	155° 18.041'
Elevation: 1,200 feet	Elevation: 1,190 feet

1.2.2 Appearance and Safety

- | | | |

1. DAS and some sensors replaced after initial audit on Sep 6, 2007.

2. New DAS and sensors audited on Sep 6-7, 2007.

3.2 Equipment Evaluation

3.2.1 Data Acquisition System (DAS) and Communications System

- | | | |
|--|---|--|
| Is the DAS well protected from the elements with adequate room for maintenance? | <input checked="" type="checkbox"/> Yes | Comments: <u>DAS inside of a weatherproof building, mounted on a 4'x4' wiring panel.</u> |
| | <input type="checkbox"/> No | |
| Is the DAS rated for operation in the expected local temperature range? | <input checked="" type="checkbox"/> Yes | Comments: <u>-55°C to + 85°C.</u> |
| | <input type="checkbox"/> No | |
| Are all sensor cables neatly and securely connected to the correct DAS channels? | <input checked="" type="checkbox"/> Yes | Comments: <u>Well organized wiring panel.</u> |
| | <input type="checkbox"/> No | |
| Is remote communication to the DAS system available to operators? | <input checked="" type="checkbox"/> Yes | Comments: <u>DAS connected to FreeWave network linked to SixNet modem on telephone grid.</u> |
| | <input type="checkbox"/> No | |
| Are all components of the DAS and communications system operational? | <input checked="" type="checkbox"/> Yes | Comments: <u>None.</u> |
| | <input type="checkbox"/> No | |

Pebble 4 PSD Meteorological Station Systems Audit

Owner: NDM Operator: Dominic Shallies Alternate: Steve Mackey Date: Sep 6-7, 2007
 Witnesses: Dominic Shallies Auditor: Eric Brudie

- Are the DAS and communication equipment properly grounded? ■ Yes Comments: 8' ground rod wired to central ground buss.
 No
- Are the DAS and communication equipment protected from lightning? ■ Yes Comments: There is no lighting protection, but area not prone to strikes.
 No

3.2.2 Power Supply System

- Does the system have a stable power supply or line power? ■ Yes Comments: Very robust alternative power supply described below.
 No

- Describe the meteorological monitoring station power supply system.

The DAS, communications equipment and meteorological sensors are powered by one 70-Watt solar panel, buffered through two 200 amp-hr deep cycle gel cell batteries. The aspirator fans and Climatronics wind sensor heaters are powered by two 70-Watt solar panels buffered through two 200 amp-hr deep cycle gel cell batteries. During the winter months (November through April), the aspirator/heater system is also powered by a propane Thermo-Electric Generator (TEG). The isolated DAS and Aspirator power systems can be interconnected during upset conditions through an array of relays managed through the DAS control ports. The DAS monitors battery levels and can connect the two power systems should one run low. The DAS also has algorithms programmed to assess weather conditions and limit heater use when not essential.

3.2.3 Meteorological Monitoring Sensors

- Do all sensors appear to be clean, intact, in good condition and well maintained? ■ Yes Comments: None.
 No
- Are all sensors operational, online and reporting data? ■ Yes Comments: None.
 No
- Do all sensors meet EPA criteria for PSD quality sensors? ■ Yes Comments: See table below.
 No
- Are spare parts stocked for items which are frequently worn out or broken? ■ Yes Comments: Spare props, cups and vanes onsite and spare bearings in field kit.
 No

3.2.4 EPA PSD Meteorological Instrument Standards

Parameter	Instrument Specifications	EPA Standard	Pass?
Air Temperature (2-M, 10-M & Delta-T) – Met One Mdl. 062MP			
Accuracy (2-m & 10-m):	±0.05 °C	±0.5 °C	Yes
Accuracy (Delta-T):	±0.02 °C	±0.1 °C	Yes
Range (Operating Temp):	-50°C to +50°C	-20°C to +30°C	Yes
*Resolution. (2-m & 10-m):	0.01°C	0.1°C	Yes
*Resolution (Delta-T):	0.01°C	0.02°C	Yes
Response Time:	10 seconds	≤1 minute	Yes
Relative Humidity – Vaisala Mdl. HMP45AC			
Accuracy:	±2/3% at 0-90/90-100% RH	±1.5°C Dew Point**	Yes
Range:	0.8% to 100% RH	-30°C to +30°C Dew Point**	Yes
*Resolution:	0.1% RH	1% RH	Yes
Response Time:	10 sec	≤30 minutes	Yes
Operating Temperatures:	-40°C to +60°C	-30°C to +30°C	Yes
** EPA criteria in units of dew point, RH and operating temperature ranges meet these criteria.

3.3 Station Location and Sensor Placement

3.3.1 Tower

- Do all obstructions exist below a 1:10 slope away from the tower base? Yes Comments: None.
 No
- Is the height of the tower at least 10 meters above the ground? Yes Comments: None.
 No
- Is the tower stable and plumb? Yes Comments: None.
 No
- Is the tower protected from lightning? Yes Comments: There is no lightning protection, but area not prone to strikes.
 No

3.3.2 Temperature Sensors

- Are the sensors mounted at least 2-m above open level ground at least 9-m in diameter? Yes Comments: None.
 No
- Are the temperature difference probes at heights of 2-m and 10-m above the ground? Yes Comments: None.
 No
- Are the sensors at a distance greater than four times the height of any obstruction? Yes Comments: None.
 No
- Is the ground beneath the temperature sensors natural native material? Yes Comments: None.
 No
- Is the site free of any natural features that could bias temperature data (e.g. open water, sloping ridge, etc.)? Yes Comments: None.
 No
- Is the site free of any man-made features that could bias temperature data (e.g. asphalt, concrete, exhaust plumes, etc.)? Yes Comments: None.
 No
- Are the sensors located at least 30 meters from large paved areas? Yes Comments: None.
 No

Pebble 4 PSD Meteorological Station Systems Audit

Owner: NDM

Operator: Dominic Shallies

Alternate: Steve Mackey

Date: Sep 6-7, 2007

Witnesses: Dominic Shallies

Auditor: Eric Brudie

Is the ambient temperature sensor protected from the influence of solar radiation?

- Yes Comments: Housed in Met One MdI 076B-4
- No Motor Aspirated Radiation Shield.

Are the temperature difference sensors located in identical aspirated shields?

- Yes Comments: Housed in Met One MdI 076B-4
- No Motor Aspirated Radiation Shields.

3.3.3 Relative Humidity Sensor

Is the relative humidity sensor open to the atmosphere & protected from precipitation?

- Yes Comments: Housed in 2-m aspirated shield with temperature sensor.
- No

3.3.4 Wind Speed and Wind Direction Sensors

Is the horizontal distance between the instruments and any obstruction at least 10 times the height of the obstruction?

- Yes Comments: None.
- No

Are the instruments at least 1.5 times nearby building height(s) above the building roof(s), or 10-m high?

- Yes Comments: None.
- No

Are the wind speed and wind direction sensors stable and plumb?

- Yes Comments: None.
- No

Is the distance of the sensor on the cross-arm at least twice the diameter of the tower?

- Yes Comments: Climatronics Sensors mounted on a crossarm which meets this criterion.
- No

Is the distance of the sensor on the cross-arm at least twice the diameter of the tower?

- Yes Comments: RM Young sensor mounted on an extension arm which meets this criterion.
- No

Is the wind direction sigma theta data being collected according to EPA requirements?

- Yes Comments: DAS calculated using Yamartino method and a one-second scan interval.
- No

3.3.5 Barometric Pressure Sensor

Is the barometric pressure sensor open to atmosphere & protected from precipitation?

- Yes Comments: Housed in unsealed shelter, mounted on the wiring panel.
- No

3.3.6 Solar Radiation Sensor

Is the instrument situated above the plane of any obstructions that could cast shadows?

- Yes Comments: None.
- No

Is the sensor situated south of the tower to minimize obstruction from the tower?

- Yes Comments: None.
- No

3.3.7 Precipitation Gauge

Are all obstructions to the wind farther away from the gauge than the obstruction height?

- Yes Comments: None.
- No

If located in an open and windy area, is a windshield being used?

- Yes Comments: Alter type shield surrounds Met-One gauge.
- No

Is the area surrounding the rain gauge covered by natural vegetation or gravel?

- Yes Comments: None.
- No

Is the instrument mounted at least 30 cm above the ground?

- Yes Comments: None.
- No

Is the instrument mounted level? Yes Comments: None.
 No

3.3.8 Evaporation Gauge

Is the evaporation pan above the plane of any obstructions that could cast shadows? Yes Comments: None.
 No

Are the pan and gauge mounted on a stable and level platform? Yes Comments: Mounted on a 6' x 8' deck supported on adjustable pier blocks.
 No

Is the evaporation pan protected from animals? Yes Comments: Six-foot fence surrounds evaporation pan and gauge.
 No

4.0 STANDARD OPERATING PROCEDURES

4.1 General

Is the station visited on a preset schedule? Yes Comments: None.
 No

Have standard SOPs been developed, and are they being followed by the operators? Yes Comments: None.
 No

Does the operator follow a preventative maintenance schedule? Yes Comments: None.
 No

Are site visits and maintenance activities properly documented in a Station Log? Yes Comments: Site visit memos are compiled.
 No

Are station operators knowledgeable and competent regarding effective operation? Yes Comments: None.
 No

Have operators attended any formal training for operating met monitoring stations? Yes Comments: The lead operator has formal training and all operators have onsite experience.
 No

Are copies of the NIST certifications for the calibration equipment made available? Yes Comments: Attached.
 No

4.2 DAS and Meteorological Sensors

Are regular multipoint QC checks performed on the DAS? Yes Comments: DAS audited by virtue of the instrument output values.
 No

Are regular multipoint QC checks performed on the meteorological sensors? Yes Comments: None.
 No

Are the sensors visually inspected for defects and problems? Yes Comments: None.
 No

Are ambient conditions compared with sensor readings from the DAS? Yes Comments: DAS output compared to Iliamna Airport weather station.
 No

Are data frequently reviewed for reasonableness and completeness? Yes Comments: None.
 No

Is a copy of the datalogger program made available for review? Yes Comments: None.
 No

5.0 DOCUMENTATION

5.1 System Reference and Maintenance Manuals

Does the operator have all required DAS and meteorological instrument manuals?

- Yes Comments: On-site and at HCG offices.
 No

Does the operator have configuration and wiring schematics specific to the station?

- Yes Comments: Operator carries wiring schematics.
 No

5.2 Station Monitoring Plan and Report Forms

Is the Monitoring/QA plan comprehensive and reflective of the actual installation?

- Yes Comments: None.
 No

Does the Monitoring/QA plan indicate the intended use for the data collected during the monitoring program?

- Yes Comments: Collect PSD quality data to meet dispersion modeling requirements and satisfy mine/transportation design requirements.
 No

Does the system outlined in the QA plan meet the objectives outlined above?

- Yes Comments: PSD quality installation.
 No

Does the QA Plan indicate the intended schedule for reports to be submitted?

- Yes Comments: None.
 No

Does the station have an activity log?

- Yes Comments: Site visit memos written after each visit to supplant a log book.
 No

Does the station have a formal Site Visit and Checklist Form?

- Yes Comments: No formal checklist used.
 No

Does the station have an adequate Operations Manual?

- Yes Comments: Monitoring/QA plan and equipment manuals.
 No

Does the station have an adequate calibration form and copies of previous audits & cals?

- Yes Comments: None.
 No

Are report forms and site logs properly completed and current?

- Yes Comments: None.
 No

6.2 Data Collection and Initial Data Review

- | | | |
|---|---|---|
| Is the station polled and data downloaded on a regular basis? | <input checked="" type="checkbox"/> Yes | Comments: <u>Daily via RF modem and telephony modem.</u> |
| | <input type="checkbox"/> No | |
| Are the monitoring station data reviewed on a regular basis? | <input checked="" type="checkbox"/> Yes | Comments: <u>Data imported into custom graphs and reviewed 5-6 days per week.</u> |
| | <input type="checkbox"/> No | |
| Are the monitoring station data screened on a regular basis? | <input checked="" type="checkbox"/> Yes | Comments: <u>Data screened using EPA criteria prior to summary compilations.</u> |
| | <input type="checkbox"/> No | |
| Are procedures in place for backing up raw data? | <input checked="" type="checkbox"/> Yes | Comments: <u>Raw data files are backed up on the HCG server and on magnetic tape.</u> |
| | <input type="checkbox"/> No | |
| Are written procedures for data handling available for the project? | <input checked="" type="checkbox"/> Yes | Comments: <u>None.</u> |
| | <input type="checkbox"/> No | |

Pebble 4 PSD Meteorological Station Systems Audit

Owner: NDM

Operator: Dominic Shallies

Alternate: Steve Mackey

Date: Sep 6-7, 2007

Witnesses: Dominic Shallies

Auditor: Eric Brudie

- Describe the data polling process and initial data evaluation.

Data is downloaded from the station on a daily basis using a dedicated data polling computer located at the HCG office. The raw *.dat file is appended to the existing raw station data file located on the HCG server, which is backed up to tape daily. The raw data are copied to an Access/Excel database file which generates custom graphs of the various meteorological and operational parameters. These graphs are reviewed 5-6 days per week in order to identify station problems. This graphical data review is the frontline of maintaining a complete and defensible dataset. Station upsets are instantly identified and repaired within days. Copies of both the raw unadjusted data and the custom database files are retained for a minimum of 5 years.

6.3 Corrective Actions

Are procedures established for initiating corrective actions during data processing?

Yes Comments: Daily graphical data review and subsequent reactions.
 No

- Describe procedures for initiating, tracking and closing corrective actions.

When nonconformance issues are recognized during graphical review, the Lead Operator/Data Manager plans and executes corrective action. A calibration check is performed on any sensor which is repaired or replaced during the action. A site visit memo outlining the nature of the problem and repairs undertaken is written and saved to the station file. Any quantifiable error is also documented for possible data validation. The Operator/Data Manager ensures the erroneous data are flagged for the period from initial noncompliance until repair and calibration are affected.

6.4 Data Validation

Are data validation procedures established and in use?

Yes Comments: None.
 No

Are adjusted and unadjusted data sets maintained?

Yes Comments: Both are backed up on the HCG server and magnetic tape.
 No

- Describe the initial data validation procedure.

Data is compiled in a custom Excel spreadsheet programmed to evaluate meteorological data against EPA recommended PSD data screening criteria. The data are screened for events such as; extended periods of zero wind speed (indicating icing or worn bearings), temperatures outside of the known monthly max/min for the area, etc. Nonconforming data are flagged by the screening program for further investigation. Also, data periods for individual parameters are flagged for times when the corresponding instrument was undergoing field servicing, calibrations or audits. Periods when instruments are known to have been out of calibration or malfunctioning are also flagged.

- Describe procedures for validating and invalidating flagged data (outliers).

Data flagged during the screening process described above are manually reviewed. If the data have a quantifiable, consistent and documented bias, they may be adjusted and then validated. Specific guidelines are detailed in the Plan. Data which have been flagged by the screening program are also compared to local weather conditions as determined from other sources. Examples where data flagged during screening may be validated include periods when winds were known to have been exceptionally calm at nearby stations or extreme temperatures outside the historical max/min were witnessed. At this point, flagged data are permanently validated and left in the database or invalidated and removed from the database. Data removed from the database are replaced with an alphanumeric code to indicate the reason for invalidation.

6.5 Data Capture

- Identify the desired data capture rate for the monitoring data.

Target rate for PSD Quality Meteorological Monitoring Data is 90%.

Is the desired data capture rate being met for each data type?

Yes Comments: None.

No

6.6 Data Reporting

Are quarterly and annual data reports being submitted for the site?

Yes Comments: None.

No

Are qualified staff personnel reviewing data reports prior to submittal?

Yes Comments: None.

No

Is finalized data set submitted with report to ADEC?

Yes Comments: None.

No

7.0 QUALITY ASSURANCE AND QUALITY CONTROL

7.1 Quality Assurance Program

Has a quality assurance plan been written describing quality assurance procedures?

Yes Comments: None.

No

Is a copy of the plan available to field and data processing personnel?

Yes Comments: None.

No

Has the quality assurance plan been approved by the ADEC?

Yes Comments: None.

No

- Identify those person(s) responsible for updating the plan SOPs.

Name: Steve Mackey

Position: Project Manager

Affiliation: Hoefer Consulting Group, Inc.

7.2 Quality Assurance Methods and Audits

Have adequate audit procedures been identified within the quality assurance plan?

Yes Comments: None.

No

Does the Plan correctly document PSD accuracy limits for calibrating and auditing?

Yes Comments: None.

No

Have audits been conducted on the suggested schedule of every six months?

Yes Comments: None.

No

COMPLIANCE

Alaska Calibration Inc.'s calibration practices and procedures comply with the requirements of ANSI/ISO/ Z540-1 and ANSI/ISO/IEC 17025: 2000 and relevant requirements of ISO 9002:1994. The standards used are certified as being traceable to the National Institute of Standards and Technology (NIST), by comparison to SI units through laboratory standards in an unbroken chain of calibrations through appropriate primary and national measurement standards, derived from an acceptable value of a natural physical constant, or derived by the ratio type of self calibration techniques. Certificate shall not be reproduced, except in full, without the written approval of Alaska Calibration, Inc.

Certificate of Calibration

Report #: 060407-X0740015-RH RMA #: 95-60966

Model #: HMI41/HMP41

Instrument Type: Humidity Transmitter

Instrument Range: 0 to 100%, RH

Instrument Range: -20 to +60 °C, T

Customer: HOEFLER CONSULTING GROUP

City, State: ANCHORAGE, AK

Calibration Date: Jun-04-2007

Serial #: X0650080/X0740015

Calibration Procedure: 11603100

Recommended Calibration Due Date: Jun-04-2008

This unit was calibrated by adjusting its reading at 0%* against a dry-air line and at 75% against reference humidity and temperature instrument, Vaisala model HMP233. Additional instrument verification checkpoints were made against HMP233 reference at 11%RH and 33%RH. Calibration and instrument verification sequences utilize a dry-air line and a set of controlled aqueous salt solutions Vaisala model HMK13B. Laboratory ambient conditions are humidity and temperature controlled. The calibration uncertainty is presented at 95% confidence level, k=2. The standard uncertainty of the measurement has been determined in accordance with U.S. Guide to the Expression of Uncertainty in Measurement. *Note: the 0% RH point is not ISO17025 Accredited.

Calibration Data (As Left)				
Temperature Calibration, °C				
Reference	Unit Under Test	Error	± Tolerance, °C	± Uncertainty, °C
21.07	21.10	0.03	0.20	0.07
Humidity Calibration, %RH				
Reference	Unit Under Test	Error	± Tolerance, %	± Uncertainty %
0.03	0.10	0.07	2.00	0.50 *
11.17	11.30	0.13	2.00	0.92
32.67	32.50	-0.17	2.00	1.01
74.78	74.80	0.02	2.00	1.02

Problem Noted: No "As Found" Data. Intermittent readings from Temp Sensor. Damage to Temp Sensor. RH sensor dirty.

Action Taken: Replaced Temp and RH sensors. The unit was calibrated.

The results of this calibration are related only to the items being calibrated at the time of calibration, and, are traceable to the National Institute of Standards and Technology through NIST Test Report Numbers TN 274176 and TN 274579-07. Vaisala's calibration system has been established to meet the requirements of ANSI/NCSL Z540-1-1994. This certificate can not be reproduced, except in full, without the expressed written consent of Vaisala. The certificate was established to comply with the requirements of ISO/IEC17025. Vaisala is ISO 9001:2000 certified.

CERTIFICATE OF CALIBRATION AND TESTING

MODEL: 18811 (Comprised of Models 18820A Control Unit & 18831A Motor Assembly)
SERIAL NUMBER: CA02136

R. M. Young Company certifies that the above equipment was inspected and calibrated prior to shipment in accordance with established manufacturing and testing procedures. Standards established by R.M. Young Company for calibrating the measuring and test equipment used in controlling product quality are traceable to the National Institute of Standards and Technology.

Nominal Motor Rpm	27106D Output Frequency Hz (1)	Calculated Rpm (2)	Indicated Rpm (3)
30.0	5	30.0	30.0
150.0	25	150.0	150.0
300.0	50	300.0	300.0
450.0	75	450.0	450.0
600.0	100	600.0	600.0
750.0	125	750.0	750.0
990.0	163	990.0	990.0

Clockwise and Counterclockwise rotation verified

- (1) Measured frequency output of RM Young Model 27106D standard anemometer attached to motor shaft
- (2) 27106D produces 10 pulses per revolution of the anemometer shaft
- (3) Indicated on the Control Unit LCD display

*Indicates out of tolerance

EPPLEY PRECISION SPECTRAL PYRANOMETER Model PSP

Serial Number: 34377F3

Resistance: 603 Ω at 23 °C

Temperature Compensation Range: -20 to 40 °C

This radiometer has been compared with Standard Precision Spectral Pyranometer, Serial Number 21231F3 in Eppley's Integrating Hemisphere under radiation intensities of approximately 700 watts meter⁻² (roughly one-half a solar constant). The adopted calibration temperature is 25 °C.

As a result of a series of comparisons, it has been found to have a sensitivity of:

$$9.29 \times 10^{-6} \text{ volts/watts meter}^{-2}$$

The calculation of this constant is based on the fact that the relationship between radiation intensity and emf is rectilinear to intensities of 1400 watts meter⁻². This radiometer is linear to within ± 0.5% up to this intensity.

The calibration of this instrument is traceable to standard self-calibrating cavity pyrheliometers in terms of the Systems Internationale des Unites (SI units), which participated in the Ninth International Pyrheliometric Comparisons (IPC IX) at Davos, Switzerland in September-October 2000.

Useful conversion facts: 1 cal cm⁻² min⁻¹ = 697.3 watts meter⁻²
1 BTU/ft²-hr⁻¹ = 3.153 watts meter⁻²

1.0 INTRODUCTION

Hoefer Consulting Group, Inc. (HCG) operates meteorological monitoring stations for The Pebble Limited Partnership, care of Pebble Mines Corporation; in support of the Pebble Mine Project near Iliamna, Alaska. The air monitoring program is one component of ongoing baseline environmental studies being conducted to support mine permitting, mine design and mine transportation infrastructure development. The stations meet Prevention of Significant Deterioration (PSD) guidelines, although PSD permits may not be required. This report covers the Pebble 4 Station (Pebble 4) located near the proposed mine site.

Pebble 4 is located approximately five miles south of the mine ore body on top of a windswept knoll at about 1,200 foot elevation. The station consists of an instrumented 11-meter sectional tower secured with three guy wires. Approximately 50 foot south of the tower is an evaporation pan and a tipping precipitation gauge mounted on a 6' by 8' deck. Between the tower and the gauges is a 5' by 7' insulated building which houses the datalogger and power supply system. Pebble 4 is instrumented with PSD quality sensors monitoring the following parameters:

- Ambient Temperature (°C): Met One 062MP Thermistor Probe at 2-m
- Temperature Difference (°C): Met One 062MP Thermistors at 2-m and 10-m
- Relative Humidity (%RH): Vaisala HMP45AC Relative Humidity Sensor
- Wind Speed 1 (m/s): Climatronics F460 P/N 100075 Wind Speed Sensor
- Wind Direction 1 (°): Climatronics F460 P/N 100076 Wind Direction Sensor
- Wind Speed 2 (m/s): RM Young 05305 Wind Monitor-AQ
- Wind Direction 2 (°): RM Young 05305 Wind Monitor-AQ
- Sigma Theta (°): Campbell Scientific CR10X DAS calculated (Yamartino)
- Barometric Pressure (mbar): Vaisala PT101B Barometric Pressure Sensor
- Solar Radiation (W/m²): LI-COR Li-200SX Solar Radiation Pyranometer
- Precipitation (mm H₂O): Met-One Model 370 Tipping Precipitation Gauge
- Evaporation (mm H₂O): Nova-Lynx Model 255-100/200 Pan and Gauge.

This report has been prepared for NDM to serve as a quantitative review of the Pebble 4 station. To that end, a Performance Audit was undertaken in order to demonstrate that the equipment installed at the meteorological monitoring station is operating correctly and meets the requirements set forth by the U.S. Environmental Protection Agency (EPA) and the Alaska Department of Environmental Conservation (ADEC).

2.0 PERFORMANCE AUDIT

2.1 Performance Audit Methodology

During the performance audit, the station datalogger is interfaced with a portable laptop computer to display the outputs for the meteorological sensors. The value of each meteorological sensor is compared to the output value from the appropriate piece of audit equipment or from calibrated instruments collocated with the sensor. The difference between the station's datalogger reading and the output from each audit instrument is compared with established PSD limits to determine the accuracy of each sensor. Additionally, threshold torques for wind speed and wind direction are measured with audit equipment and compared with manufacturer torques corresponding to the PSD threshold speed of 0.5 m/s. Table 2-1 provides a summary of the performance audit methods and limits used to audit each parameter at the stations.

Table 2-1 Performance Audit Methods and Acceptable Limits

Parameter	Audit Method	EPA/Manufacturer Limit
Datalogger Time	NOAA Clock	$\leq \pm 5:00$ minutes from AST
Temperature Accuracy	Collocated NIST thermistor	$\leq \pm 0.5$ °C
Temperature Difference	Collocated NIST thermistor	$\leq \pm 0.1$ °C
Relative Humidity	Collocated NIST RH sensor	$\leq \pm 1.5$ °C of dew point
Wind Speed Accuracy	Synchronous rpm motor	$\leq \pm 0.2$ m/s + 5 % observed
Wind Spd Torque (Clim)	Torque watch	≤ 0.35 g-cm (0.0049 oz-in)
Wind Spd Torque (RMY)	Torque watch	≤ 1.0 g-cm (0.014 oz-in)
Wind Direction Alignment	GPS, compass or landmark	$\leq \pm 5$ ° from true azimuth
Wind Direction Accuracy	Linearity tester	$\leq \pm 5$ ° per audit point
Wind Direction Linearity	Linearity tester	≤ 3 ° mean absolute average
Wind Dir Torque (Clim)	Torque watch	≤ 7.5 g-cm (0.104 oz-in)
Wind Dir Torque (RMY)	Vane torque gauge	≤ 11 g-cm (0.153 oz-in)
Barometric Pressure	Collocated NIST BP sensor	$\leq \pm 3$ mbar
Solar Radiation	Collocated NIST sensor	$\leq \pm 5\%$ of input+resolution ¹
Precipitation	Calibrated water volume	$\leq \pm 10\%$ of input
Evaporation	Measured water level	$\leq \pm 10\%$ of input

1. This audit limit is modified from PSD standard, as discussed below.

2.1.1 Data Acquisition System

An audit of the datalogger is conducted by comparing all datalogger outputs to the audit standards, as described below. The datalogger time is checked against an instantaneous time reading from the National Oceanic and Atmospheric Administration (NOAA) clock in Boulder, Colorado, via a global positioning system (GPS) handheld unit or telephone contact with the NOAA clock.

2.1.2 Air Temperature and Air Temperature Difference

The 2-meter and 10-meter thermistors are removed from their aspirator shields and collocated with a National Institute of Standards and Technology (NIST) traceable digital thermometer. The station thermistors and the transfer standard NIST thermometer are taped together and immersed in insulated thermoses containing a series of fluid baths; hot water (35°C to 45°C), warm water (15°C to 25°C), water/ice bath (0°C), cold glycol (-15°C to -25°C) and very cold glycol (-35°C to -45°C). Dry ice is used to cool the glycol baths. Each liquid bath is agitated and allowed to equilibrate before simultaneous readings are taken from the three instruments.

An alternate method can also be used for the low temperature audits, employing a Thermal Mass Device (TMD). The TMD consists of a 6" diameter by 9" high solid aluminum block milled to fit snuggly inside of an insulated Dewar flask. On the top of the TMD, and in corresponding locations on the flask lid, are holes sized to accommodate a variety of Campbell, Climatronics, Met-One and VWR thermistors. The TMD is cooled to the target temperatures by contact with dry ice and then placed in the insulated flask. The audit and station thermistors are inserted through the flask lid and into the appropriate holes in the TMD. After the TMD and the thermistors are allowed to equilibrate, readings for all thermistors are simultaneously taken. The aluminum TMD has a very high thermal conductivity and when allowed to equilibrate inside of the insulated flask, thermal gradients across the TMD are very small.

In all cases, the difference between the individual station thermistors and the NIST standard are compared to the PSD temperature accuracy limit of $\pm 0.5^{\circ}\text{C}$. The difference between the two station thermistors (10-m°C minus 2-m°C) is compared to the PSD temperature difference limit of $\pm 0.1^{\circ}\text{C}$.

2.1.3 Relative Humidity

Relative humidity (RH) is audited using a collocated NIST traceable RH sensor. The NIST sensor and the field sensor are collocated out of direct sunlight to eliminate solar radiation effects, preferably inside of the motor aspirated shield. If the NIST standard reads directly in dew point °C, those readings are used; if not, relative humidity and

temperature readings are used. For the audit; instantaneous readings of dew point, relative humidity and ambient temperature are recorded from the transfer standard and the DAS. All relative humidity and temperature readings are converted to dew point in order to assess the PSD error limit of $\pm 1.5^{\circ}\text{C}$ dew point.

2.1.4 Wind Speed

Anemometers are audited to determine their accuracies in reading known wind speeds and to ascertain the sensor's threshold torque. The Climatronics and RM Young sensors are audited in very similar manners and are discussed together. The instruments are tested after removal from the tower and after removal of the sensor's props or cups.

First, an RM Young synchronous motor is attached to the shaft of the anemometer by using brand specific coupling devices. The sensor shaft is rotated at several different known revolutions per minute (rpm). Each rotational speed in rpm is equated to a wind speed in meters per second (m/s) by using the anemometer manufacturer's linear calibration formula. The difference between the calculated input speed in m/s and the datalogger output is compared to established PSD limits for each input rpm.

Next, a high precision torque watch is attached to the shaft of the anemometer, once again using custom couplings. Torque readings are made in both directions in each quadrant along the axis of rotation of the shaft. The maximum reading is recorded for the torque required to turn the shaft of the anemometer. The torque value recorded during the audit is compared to manufacturer's torque corresponding to the minimum PSD threshold speed of 0.5m/s.

2.1.5 Wind Direction

The wind direction sensors are first audited as-found to determine the accuracy of their alignment with respect to true north (true azimuth alignment) using one of four methods. In one method, a handheld GPS unit is used to measure the position of the auditor with respect to a waypoint captured under the wind sensor's position on the tower. Using binoculars, the tail of the wind vane is aligned with the auditor's position at a distance of several hundred feet from the tower. The GPS bearing back to the tower waypoint is then compared to the DAS reading. The difference between the two should not exceed $\pm 5^{\circ}$ per audit point. This procedure is repeated at least 4 times, once per quadrant, generally near the cardinal directions. The second method uses a calibrated precision compass mounted on a gimbal and tripod. The compass declination is preset for the specific location and date using one of a variety of magnetic declination computer models. The sensor tail is aligned toward the auditor while auditor sights the

compass toward the sensor and readings are taken in a similar manner to the GPS method.

Another option is to align the tail of the sensor with a distant identifiable landmark of known bearing. The bearing to the landmark may be ascertained using a variety of methods. One method involves physically capturing a distant GPS waypoint, such as at a discernable structure or emissions stack. Bearings to inaccessible natural landmarks, usually distant mountain peaks, are acquired through the use of various computer mapping programs, such as Natural Geographic's TOPO program or USGS digital raster graphics (DRGs) loaded into AutoCAD. The bearing from the station location to the landmark is compared to the DAS reading. This method yields the most accurate audit value, but is limited by weather and availability of discernable landmarks. The final method is to align the vane with the tower guy wires or preset survey markers, whose bearing has been ascertained using precision survey equipment.

The wind direction accuracy and linearity are subsequently audited after the wind direction sensor is removed from the tower. The Climatronics sensor is mounted on a Climatronics Model 101984 linearity tester and the RM Young sensor is mounted on an RM Young Model 18112 Vane Angle Bench Stand. Both test fixtures are keyed to their respective sensor and graduated from 0° to 360°. A series of readings starting at 30° and then clockwise in 30° increments are taken. The RM Young is read from 30° to 360° and the Climatronics is read from 30° to 540°. The Climatronics sensor is tested 180° past 360° in order to test the second potentiometer used in some DAS programming. Although not required, the Climatronics sensor is also tested with the vane attached in order to ascertain sensor accuracy and linearity relative to the instrument crossarm. The vane is aligned along the axis of the crossarm to yield the 0°/360° and 180° values and against a square held to the crossarm for the 90° and 270° directions. Four readings are taken in a clockwise direction and four are taken counterclockwise to complete the test. For both the linearity test fixture and crossarm tests, individual error values are assessed for the PSD accuracy limit of ±5° per point and the mean absolute average error is assessed against the linearity limit of 3°.

Next, the RM Young wind direction threshold is tested by measuring wind vane torque using an RM Young Model 18331 Vane Torque Gauge. This device saddles the wind vane and a calibrated spring is pulled to determine maximum torque from readings taken in both directions in all four quadrants. The Climatronics wind direction starting torque is measured with the vane removed by using a precision torque watch in the same manner as the wind speed torque. The highest torque readings are compared to specific manufacturer limits for instrument starting torque.

Finally, the wind direction sensors are placed back on the tower and as-left audits of the azimuth alignments are conducted to ensure the instruments are properly reinstalled.

2.1.6 Barometric Pressure

Barometric pressure (BP) is audited using a collocated NIST traceable BP sensor. The difference between the NIST sensor and the station sensor are compared to the PSD limit of ± 3 mbar.

2.1.7 Solar Radiation

Outputs of the station sensor are compared to the output of a level collocated audit solar radiation sensor. The audit sensor is connected to an independent audit datalogger with the scan interval and clock synchronized with the station DAS. Hourly average solar radiation readings and instantaneous readings are recorded during the audit and then input into a custom spreadsheet to calculate a linear regression for the data. The PSD limit for solar radiation audits is $\pm 5\%$ of observed, but this standard is very difficult to obtain at the northern latitude of this installation. This EPA standard is currently undergoing review and is expected to change. A well accepted substitute is that individual DAS and audit data pairs are compared to a limit of $\pm 5\%$ of observed + **EPA minimum instrument resolution (10W/m^2)**. Individual data pairs are evaluated against this standard, but the overall set is restricted to a 5% error by limiting allowable linear slope to 1.0 ± 0.05 .

2.1.8 Precipitation

The Met-One tipping precipitation gauge is audited by slowly adding precisely measured volumes of water to the gauge using a dripping Nova Lynx Model 260-2595 Rain Gauge Calibrator. The predicted millimeters of precipitation corresponding to the measured volume added are calculated using the diameter of the gauge opening. The tare reading from the DAS is initially recorded and subsequent DAS readings are recorded after each test run. The percent difference between the predicted audit value and the DAS value is compared to the PSD limit of $\pm 10\%$.

2.1.9 Evaporation

The evaporation gauge is first checked to confirm that the pan and gauge are level. The accuracy is checked by first removing or adding enough water to bring the initial level to approximately 50 mm or 240 mm, the minimum and maximum for this gauge. An accurate millimeter scale is taped to the inside of the evaporation pan and the water level on the scale is compared to the DAS output. Water is added to or removed from the pan to change the level by 10-20mm and another set of readings are taken. This process is repeated until the level in the pan reaches the upper or lower limit of the

gauge. The resultant suite of DAS and scaled water level readings are then input into a custom spreadsheet which calculates a linear regression for the data. The evaporation gauge reads change in water level due to evaporation and rainfall, so the calculated intercept must be removed from measured water levels. The adjusted level is compared to the DAS output with a maximum allowable error of $\pm 10\%$ of input and the slope of resultant line has a limit of 1.0 ± 0.1 .

2.2 Performance Audit Results

A performance audit was conducted at the Pebble 4 station on February 12-13, 2008, with Dominic Shallies of HCG assisting. The ambient temperature was too low to use the low flow tester required for the tipping precipitation gauge, so that instrument was tested on a March 6, 2008. All sensors were challenged with certified audit equipment and all instruments except the thermistors yielded errors below the PSD limits. The thermistors were replaced and re-audited. Table 2-2 contains summary data from the audit and complete audit reports and audit equipment calibration certificates are contained in Appendix A and Appendix B respectively.

2.3 Performance Audit Recommendations

- None.

COMPLIANCE

Alaska Calibration Inc.'s calibration practices and procedures comply with the requirements of ANSI/ISO/ Z540-1 and ANSI/ISO/IEC 17025: 2000 and relevant requirements of ISO 9002:1994. The standards used are certified as being traceable to the National Institute of Standards and Technology (NIST), by comparison to SI units through laboratory standards in an unbroken chain of calibrations through appropriate primary and national measurement standards, derived from an acceptable value of a natural physical constant, or derived by the ratio type of self calibration techniques. Certificate shall not be reproduced, except in full, without the written approval of Alaska Calibration, Inc.

Certificate of Calibration

Report #: 060407-X0740015-RH RMA #: 95-60966

Model #: HMI41/HMP41

Instrument Type: Humidity Transmitter

Instrument Range: 0 to 100%, RH

Instrument Range: -20 to +60 °C, T

Calibration Date: Jun-04-2007

Serial #: X0650080/X0740015

Calibration Procedure: 11603100

Recommended Calibration Due Date: Jun-04-2008

Customer: HOEFLER CONSULTING GROUP

City, State: ANCHORAGE, AK

This unit was calibrated by adjusting its reading at 0%* against a dry-air line and at 75% against reference humidity and temperature instrument, Vaisala model HMP233. Additional instrument verification checkpoints were made against HMP233 reference at 11%RH and 33%RH. Calibration and instrument verification sequences utilize a dry-air line and a set of controlled aqueous salt solutions Vaisala model HMK13B. Laboratory ambient conditions are humidity and temperature controlled. The calibration uncertainty is presented at 95% confidence level, k=2. The standard uncertainty of the measurement has been determined in accordance with U.S. Guide to the Expression of Uncertainty in Measurement. *Note: the 0% RH point is not ISO17025 Accredited.

Calibration Data (As Left)				
Temperature Calibration, °C				
Reference	Unit Under Test	Error	± Tolerance, °C	± Uncertainty, °C
21.07	21.10	0.03	0.20	0.07
Humidity Calibration, %RH				
Reference	Unit Under Test	Error	± Tolerance, %	± Uncertainty %
0.03	0.10	0.07	2.00	0.50 *
11.17	11.30	0.13	2.00	0.92
32.67	32.50	-0.17	2.00	1.01
74.78	74.80	0.02	2.00	1.02

Problem Noted: No "As Found" Data. Intermittent readings from Temp Sensor. Damage to Temp Sensor. RH sensor dirty.

Action Taken: Replaced Temp and RH sensors. The unit was calibrated.

The results of this calibration are related only to the items being calibrated at the time of calibration, and, are traceable to the National Institute of Standards and Technology through NIST Test Report Numbers TN 274176 and TN 274579-07. Vaisala's calibration system has been established to meet the requirements of ANSI/NCSL Z540-1-1994. This certificate can not be reproduced, except in full, without the expressed written consent of Vaisala. The certificate was established to comply with the requirements of ISO/IEC17025. Vaisala is ISO 9001:2000 certified.

Traceable frequency meter used in calibration Model: DP5740 SN: 4863

Date of inspection 28 Nov 2007
Inspection Interval One Year

Tested By

EJC

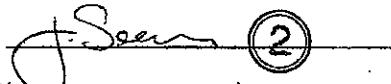

Certificate of Calibration

The instrument listed below meets or exceeds published specifications and has been calibrated under controlled conditions and is traceable to the National Institute of Standards and Technology(N.I.S.T.), or to accepted intrinsic standards of measurement, or by the ratio type of self-calibration techniques. Cal-Tech Calibration conforms to the following, ANSI/NCSL Z540-1-1994, ISO/IEC 25/17025.

Customer: Hoefer	Date: 12-05-07

Calibration Completed by: Cal-Tech Calibration, Inc.
Original Certificate (attached) #4327

Reference HPI S/O #14549

We certify the equipment used for this calibration is traceable to NIST through one or more of the following numbers:

: VENDOR MASTER

Last / Next Cal Dates: →

Gage Status: PASS

Next Calibration Due: 1/10/2008

Certified By: Denice V. Mills Signature: Denice V. Mills

This certificate is not valid unless all 1 page(s) are present.

*Laboratory Environmental Conditions: Temperature: 68°F +/- 3.6°F and/or 20C +/- 2C, Relative Humidity: between 40% and 60%.

*Calibration measurements are performed in accordance with guidelines set forth in ANSI/NCSL Z540-1-1994 and Houston Precision's Quality manual.

*The measurement of uncertainty has not been taken into account when reporting readings "in" or "out of tolerance" on this calibration report.

*If additional information regarding this calibration is required, please contact this laboratory.

*All calibrations have been performed under the supervision and authority of Omar Martinez, Lab Manager.

*Any number of factors may cause the subject of this calibration to drift out of calibration before the recommended interval has expired.

HPI will not be held responsible for the calibration status of an item whose calibration interval exceeds the actual validity of the calibration.

*This Report shall not be reproduced except in full, or with the expressed written permission of Houston Precision, Inc.

THE BRUNTON COMPANY

Certificate Of Calibration

Equipment Owner: HOEFLER Consulting Group

Name: _____

Address: 3401 minnesota DR. STE. 300

City, State, Zip: ANCHORAGE AK 99503

Calibration traceable to the National Institute of Standards and Technology in accordance with Mil-STD-45662A has been accomplished on the instrument listed below by comparison with standards maintained by The Brunton Co. The accuracy and stability of all standards maintained by The Brunton Co. are traceable to national standards maintained by the National Institute of Standards and Technology in Washington, D.C. and Boulder, CO. Complete record of all work performed is maintained by The Brunton Co. and is available for inspection upon request.

This Unit has been calibrated to Lietz TM10E serial number 30937 traceable to N.B.S. no. 738 227675 this 18th Day of JANUARY 2008

DESCRIPTION: POCKET TRANSIT

STANDARDIZATION OF EPPELEY PRECISION SPECTRAL PYRANOMETER Model PSP

Serial Number: 34377F3

Resistance: 603 Ω at 23 °C

Temperature Compensation Range: -20° to +40 °C

This radiometer has been compared with Standard Precision Spectral Pyranometer, Serial Number 21231F3 in Eppley's Integrating Hemisphere under radiation intensities of approximately 700 watts meter⁻² (roughly one half a solar conatant).

As a result of a series of comparisons, it has been found to have a sensitivity of:

$$9.24 \times 10^{-6} \text{ volts/watts meter}^{-2}$$

The calculation of this constant is based on the fact that the relationship between radiation intensity and emf is rectilinear to intensities of 1400 watts meter⁻². This radiometer is linear to within ± 0.5% up to this intensity.

The calibration of this instrument is traceable to standard self-calibrating cavity pyrheliometers in terms of the Systems Internationale des Unites (SI units), which participated in the Tenth International Pyrheliometric Comparisons (IPC X) at Davos, Switzerland in September-October 2005.

Eppley recommends a minimum calibration cycle of five (5) years but encourages annual calibrations for highest measurement accuracy. Unless otherwise stated in the remarks section below or on the Sales Order, the results are "AS FOUND / AS LEFT".

Useful conversion facts: 1 cal cm⁻² min⁻¹ = 697.3 watts meter⁻²
1 BTU/ft²-hr⁻¹ = 3.153 watts meter⁻²
